NOVAR Asset Intelligence

Consolidated Master Blueprint

Version 1.3 with Implementation Addendum

September 30 2026

Policies, technical specifications, operating procedures, contract forms and measurable acceptance gates for legal, product, engineering, operations and finance.

Part I preserves the full Version 1.2 blueprint. Part II adds the implementation controls and standardized templates requested by leadership.

Status: proposed control baseline for adoption. Production approvals, licenses, source rights, contracts and insurance must be evidenced before launch.

CONFIDENTIAL | PROPRIETARY TO NOVAR DEVELOPMENT GROUP

Document navigation

Physical PDF pages 3-23 contain the preserved Version 1.2 blueprint. The addendum begins at physical page 24 and uses A-page footer numbers. Historic page labels inside Part I are preserved.

NOVAR ASSET INTELLIGENCE™

Private National Asset Discovery, Recovery & Acquisition Network

ALL-PHASES MASTER DEVELOPER BLUEPRINT

IMPLEMENTATION CONTROL EDITION

VERSION 1.2 CHANGE: DIRECT-STATE CONTINUOUS DISCOVERY™
Immediate ingestion after official source publication - no third-party delay.

50 States + District of Columbia + Applicable Federal Sources

Find the Asset. Find the Owner. Find the Opportunity.

CONFIDENTIAL - PROPRIETARY TO NOVAR DEVELOPMENT GROUP
Version 1.2 - September 2026

Version 1.2 - Amendment Authority and Change Record

This Version 1.2 is the controlling consolidated developer blueprint. It preserves the Version 1.1 base controls and adds the direct-state continuous-ingestion requirements below. Where a Version 1.2 requirement conflicts with Version 1.1 language concerning sweep frequency, source priority, connector timing, stale-feed monitoring or acceptance testing, Version 1.2 controls.

CONTROLLING PRODUCT REQUIREMENT
NOVAR must connect directly to every approved official state source and detect, ingest, normalize and alert on newly published weekly records within a target of 5-15 minutes after publication. A delayed third-party feed must never be the primary freshness source when an approved direct official source is available.

1.1 Scope of this revision

- Adds NOVAR Continuous Discovery™ and Direct-State Instant Ingestion as production capabilities.
- Replaces any weekly NOVAR sweep assumption with continuous source monitoring plus scheduled reconciliation.
- Separates government publication delay from NOVAR detection and processing delay.
- Establishes an official-source-first hierarchy and limits delayed aggregators to backup, verification and enrichment.
- Adds connector service levels, publication-window monitoring, freshness displays, stale-source escalation and measurable acceptance tests.
- Preserves every legal, data-rights, security, identity, compensation and partner-access gate in Version 1.1.

1.2 Sections amended

Base section	Version 1.2 treatment
12 - NOVAR Guardian AI™	Expanded to monitor publication schedules, detection latency, feed freshness and missed releases.
13 - National Sweep & Asset Graph	Expanded with Continuous Discovery, delta ingestion, event processing and four source timestamps.
14 - First Look / WATCH	WATCH becomes an active priority-monitoring state, not a passive scheduled recheck.
17 - Source Permission Classes	Adds ingestion mode, source priority and connector service-level requirements.
19 - Core Technical Architecture	Adds scheduler, change detector, event bus, delta processor, alert dispatcher and freshness service.
20 - Core Data Objects	Adds SourcePublicationSchedules, SourceSnapshots, ChangeEvents, IngestionRuns, FreshnessStatuses and AlertEvents.
22 - Development Roadmap	Phases 3-5 now require direct-state continuous-ingestion capabilities and acceptance tests.

13A. NOVAR Continuous Discovery™

NOVAR shall not wait for a weekly internal sweep after a state publishes its weekly records. The platform shall continuously monitor each approved official state source and initiate ingestion as soon as a new publication, file, record set, version marker, checksum or authorized page change is detected.

13A.1 Source latency truth

Timestamp	Definition	Control owner
source_event_at	When the underlying government, court, property or asset event occurred, if supplied.	Source agency
source_published_at	When the official source made the record or dataset available.	Source agency
novar_detected_at	When NOVAR first detected the publication or change.	NOVAR
novar_processed_at	When normalization, dedupe, provenance and initial scoring completed.	NOVAR
novar_alerted_at	When the authorized alert was dispatched.	NOVAR

The platform may use the term 'instant' only to mean immediate processing after official source publication. It must never imply access before the government source publishes or authorizes release.

13A.2 Source-priority hierarchy

Priority	Source	Required method	Permitted role
P1	Official webhook, event stream or push feed	Immediate event-triggered ingestion	Primary
P2	Official API with incremental or modified-since access	Continuous/adaptive polling within approved limits	Primary
P3	Official bulk file, open-data export or scheduled download	Publication-window detection and delta import	Primary
P4	Official website with permitted automated access	Change detection within terms and rate limits	Primary when P1-P3 unavailable
P5	Licensed third-party source	Verification, backup, history or enrichment	Secondary
P6	Human-only or restricted source	Research task under documented controls	Exception

13A.3 Connector operating requirements

Control	Developer requirement
Publication schedule	Store expected weekday, time window, time zone, holidays, irregular release history and last confirmed publication.
Adaptive monitoring	Increase checks around the expected publication window; reduce checks outside that window without disabling health monitoring.
Delta detection	Use API cursors, updated-since fields, ETags, Last-Modified, file metadata, checksums, stable record keys or approved structured diffs.
Immutable evidence	Retain permitted source URL, retrieval time, source version, checksum and evidence snapshot according to the Data Rights Record.
Idempotency	Reprocessing the same publication must not create duplicate assets, opportunities, alerts or partner assignments.
Schema safety	Quarantine breaking schema changes; do not silently map uncertain fields into production asset data.
Retries	Use bounded exponential retry, dead-letter handling and Guardian escalation without violating source rate limits.
Reconciliation	Run a scheduled full comparison after each weekly release to detect missed deltas and prove completeness.
Kill switch	Disable one connector or one source action without stopping unrelated states or workflows.

13A.4 Detection and alert pipeline

- Detect an authorized source change and create a signed, immutable ChangeEvent.
- Place the event on a durable queue; acknowledge only after durable storage.
- Retrieve the new delta or publication and validate file type, checksum, size and schema.
- Normalize records while preserving raw-source provenance and source-use restrictions.
- Apply idempotent deduplication and entity resolution; uncertain merges remain separate and reviewable.
- Update the NOVAR Asset Graph™ and run approved scoring and strategy rules.
- Apply legal, data-rights, authorization and NOVAR First Look gates before external visibility.
- Dispatch authorized dashboard, email, SMS or push alerts and record delivery status.

13A.5 WATCH priority monitoring

WATCH records shall be indexed against relevant connectors, names, aliases, businesses, parcels, estates and case identifiers. When a direct-source change matches a WATCH record, the event receives priority processing. WATCH does not bypass compliance, identity verification, source rights, Novar First Look or partner-assignment controls.

12A. Guardian AI - Publication and Freshness Controls

Guardian AI shall continuously measure each connector without changing legal or data-rights decisions.

Monitor	Required behavior
Publication-window watch	Confirm each state/source release against its learned and configured publication window.
Detection latency	Measure source_published_at to novar_detected_at; target 5-15 minutes where technically and contractually supported.
Processing latency	Measure novar_detected_at to novar_processed_at and novar_alerted_at.
Stale feed	Warn when source age exceeds the connector-specific freshness threshold.
Missed release	Escalate when a normally scheduled release is absent; do not fabricate an update.
Third-party divergence	Compare secondary sources to official data and flag mismatches without allowing the secondary source to overwrite official provenance.
Schema/auth/rate limit	Quarantine unsafe changes and retry safely within documented limits.
Completeness proof	Reconcile record counts, checksums and expected partitions after each release.

19A. Architecture additions

Component	Function
Source Schedule Registry	Expected release windows, time zones, holidays, rate limits, permission class and current service level.
Change Detection Service	API cursors, file/hash checks, conditional requests and permitted structured page change detection.
Durable Event Bus	At-least-once delivery with idempotency keys, retry policy, dead-letter queue and replay.
Delta Ingestion Workers	Source-specific parsing, validation, normalization, provenance and rights-aware retention.
Freshness Service	Source age, detection latency, processing latency, completeness and source-health status.
Alert Dispatcher	Priority routing to Novar, then authorized users after release gates; delivery receipt and retry.

20A. Required data objects and fields

Add SourcePublicationSchedules; ConnectorServiceLevels; SourceSnapshots; SourceVersions; ChangeEvents; IngestionRuns; IngestionPartitions; ReconciliationRuns; FreshnessStatuses; AlertEvents; AlertDeliveries; WatchSubscriptions; ConnectorIncidents. Every material record must retain source_id, official_source_flag, source_version, source_published_at, novar_detected_at, novar_processed_at, provenance_uri/reference, checksum where permitted, rights_class and retention rule.

22A. Revised Development Roadmap Requirements

Phase	Version 1.2 addition
Phase 3 - Source Rights & Connector SDK	Add official-source priority, publication schedules, connector service levels, conditional requests, delta cursors, hashes, rights-aware evidence capture and connector kill switches.
Phase 4 - National Sweep & Asset Graph	Build the durable event bus, idempotent delta pipeline, reconciliation jobs, freshness service, direct-state dashboards and latency metrics.
Phase 5 - Unclaimed Property Discovery	Implement official direct-state connectors first; run weekly publication-window monitoring, immediate delta ingestion, Novar First Look alerts and post-release completeness reconciliation.
Phase 6 - Texas Deep Pilot	Prove the complete publish-detect-process-alert cycle with official Texas sources before national scale.
Phase 21 - Deep Connector Expansion	Promote state sources only after legal, data-rights, security, schema, load and service-level gates pass.

23A. Developer Acceptance Tests

Test	Pass condition
Direct-source proof	For every activated state, the production connector identifies the official source and proves that no delayed reseller is the primary freshness source.
Latency	For supported connectors, at least 95% of detected official publications enter NOVAR within 15 minutes; exceptions carry an incident record and source-specific explanation.
No duplicates	Repeated delivery, retry and replay of the same publication produces one canonical record/change and no duplicate partner alerts.
Completeness	Post-release reconciliation matches the official publication or records a quantified, reviewable exception.
Source truth	The UI displays official publication time, NOVAR detection time, processing time, freshness and source status.
Rights enforcement	A quarantined, expired, prohibited or human-only connector cannot execute unauthorized automated retrieval.
Failover	Secondary data may maintain awareness during an official-source outage but remains visibly secondary and cannot silently replace official provenance.
Alert security	Novar receives First Look; partner alerts occur only after release, eligibility, assignment and authorization checks.

DEFINITION OF DONE

A state is not DIRECT-STATE LIVE until its official connector, data-rights record, publication schedule, delta method, reconciliation method, freshness display, alert routing and acceptance-test evidence are approved.

Restated Base Blueprint

The following pages reproduce the Version 1.1 base implementation controls, beginning with Section 1. Those controls remain effective except where expressly amended or superseded by the Version 1.2 controls above.

READING RULE

Version 1.2 direct-state and continuous-discovery controls govern sweep frequency, freshness, source priority, ingestion timing, publication monitoring and related developer acceptance requirements. All other Version 1.1 controls remain in force.

Base controls preserved: legal memoranda, compensation routing, data rights, identity/heirship limits, security, partner isolation, conflict protection, source permissions, ledger separation, technical architecture, roadmap and production release gates.

1. Purpose of Version 1.1

Version 1.1 converts six high-risk concepts from general requirements into enforceable implementation controls: state-by-state legal analysis, transaction-specific compensation design, connector-specific data rights, AI limits on identity/heirship conclusions, security from Day One, and multi-layer partner conflict/circumvention protection.

Design principle: NOVAR must not merely document these controls. The application must prevent restricted actions unless the applicable legal, data-rights, security and assignment gates are satisfied.

2. Core Product Mission

NOVAR Asset Intelligence is a private AI operating system for national asset discovery, identity resolution, estate/heir intelligence, property and acquisition intelligence, recovery workflow, legal/compliance routing, exclusive partner allocation and transaction management.

Core sequence: DISCOVER → CONNECT → VERIFY → VALUE → LEGAL/DATA-RIGHTS GATE → NOVAR FIRST LOOK → KEEP / PARTNER / RELEASE → EXCLUSIVE ASSIGNMENT → EXECUTE → CLOSE → ACCOUNT.

3. Locked Business Model

- **Novar owns the platform, master intelligence layer and NOVAR Asset Graph™.**
- **100 external partner positions maximum: two per U.S. state.**
- **Target partner subscription: $10,000/month.** At 100 occupied seats, gross subscription run-rate is $1,000,000/month or $12,000,000/year before operating costs, taxes, churn and processing.
- **Target partnered economics: 60% Novar / 40% assigned partner only where a transaction-specific legal model permits it.**
- **Novar receives material discoveries first.** Partners never receive unrestricted access to the master opportunity pool.
- **One deal, one active partner.** A protected opportunity cannot be independently worked by multiple partners unless Novar explicitly creates a collaborative transaction.
- **Integrated attorneys.** Legal work routes through approved counsel by jurisdiction and matter type; legal fees remain separate from Novar/partner economics.

4. Implementation Control A - State-by-State Legal Analysis

The term **50-state compliance** is not implemented as one generic rules spreadsheet. It is implemented as a legal knowledge system consisting of asset-type and workflow-specific legal memoranda, rule objects, approval records and decision logs.

The production system must not label a state/asset workflow COMPLIANCE READY until the relevant memorandum has been completed and approved by qualified counsel or an authorized legal/compliance reviewer under Novar's policy.

4.1 Legal Memorandum Unit

The atomic legal unit is: **Jurisdiction + Asset Type + Workflow.** Examples: Texas + State Unclaimed Property + Recovery Agreement; Texas + Tax Sale Excess Proceeds + Assignment; Florida + Probate Property + Acquisition; California + Unclaimed Property + Locator Contract.

Required Memo Field	Implementation Requirement
Memo ID	Permanent identifier linked to production rules.
Jurisdiction	State/D.C./federal and, where necessary, county/court.

Required Memo Field	Implementation Requirement
Asset Type	Unclaimed property, real estate, probate, court funds, bankruptcy, minerals, etc.
Workflow	Discovery, solicitation, agreement, assignment, acquisition, referral, legal service, payout, etc.
Issue Statements	Specific legal questions the workflow depends on.
Authorities	Statutes, regulations, rules, official guidance, cases if relied upon.
Effective Date	Date the analysis becomes effective.
Next Review Date	Mandatory re-review interval.
Attorney/Reviewer	Name, jurisdictional authority and review status.
Risk Rating	Green / Yellow / Red with rationale.
Permitted Actions	Actions the platform may enable.
Restricted/Prohibited Actions	Actions the platform must block.
Compensation Rule	Permitted model, cap, restrictions and exceptions.
Solicitation Rule	Permitted channels, timing, disclosures and restrictions.
Required Documents	Approved templates, disclosures, signatures, notarization, filing.
Decision Trail	Why the production rule was created/changed and who approved it.
Version	Immutable version number linked to executed cases.

4.2 Legal Rule Publishing Workflow

DRAFT MEMO → LEGAL REVIEW → RULE EXTRACTION → TEST ENVIRONMENT → APPROVAL → EFFECTIVE DATE → PRODUCTION PUBLISH → CONTINUOUS MONITORING → SUPERSEDE/REVOKE.

- AI may summarize authorities and flag changes, but may not self-publish a legal rule to production.
- Every case stores the exact legal-rule version used when the action occurred.
- If a rule is revoked or materially changed, the platform can freeze affected outreach, contracts, assignments or payments through a Compliance Kill Switch.
- Historic cases remain auditable against the rule version that governed them at the time.

4.3 State Activation Gate

Status	Requirement
DISCOVERY READY	Approved source/use exists; discovery may occur.
LEGAL RESEARCH IN PROGRESS	Findings may be internal-only; no restricted commercial action.
COMPLIANCE READY	Required memoranda/rules approved for specified asset workflows.
ATTORNEY READY	Required licensed counsel network is available.
TRANSACTION READY	Permitted contracts, compensation model and workflow controls approved.
PARTNER READY	Partners may receive this asset/workflow in the state.

5. Implementation Control B - Compensation Design by Transaction Type

The 60/40 concept is not stored as a universal percentage. NOVAR uses a **Compensation Model Engine** that selects a lawful commercial structure based on the specific transaction.

Transaction Type	Potential Model	System Rule
Recovery / Locator Service	Fee for permitted recovery assistance	Use only if applicable law permits the activity and fee; enforce caps, waiting perio
Real Estate Acquisition	Purchase/resale/development economics	Treat as acquisition economics, not a recovery fee; apply real-estate, licensing, di
Joint Venture / Partnered Deal	Contractual economic participation	60/40 may be used only if lawful for that transaction and documented in an approv
Legal Services	Attorney-client legal fee	Attorney-controlled; segregated from Novar/partner compensation and subject to
Referral / Introduction	Referral or marketing compensation	Enable only where lawful; block prohibited fee sharing or unlicensed compensatio
Subscription	$10,000/month target partner membership	Independent of whether a specific regulated transaction permits a success-based
Data / Intelligence Access	Permitted intelligence service	Subject to source-license downstream-use and resale restrictions.
Acquisition Support / Operations	Service or management fee where lawful	Separate from legal fees and restricted brokerage/referral compensation.

5.1 Compensation Decision Object

- transaction_type
- jurisdiction
- asset_type
- role_of_novar
- role_of_partner
- role_of_attorney
- owner/heir relationship
- fee/split basis
- maximum permitted amount or percentage, if applicable
- required license/registration
- required disclosures
- approved agreement template
- legal memo/rule version
- attorney approval status
- payment-routing instructions
- prohibited combinations

5.2 Payment Guardrails

The finance system refuses to calculate or release a transaction split until the Compensation Model Engine returns APPROVED. If the transaction has mixed components, each component is separately classified and accounted for.

Example: an attorney fee cannot be rolled into the Novar/partner 60/40 calculation. A statutory recovery-fee cap cannot be bypassed by relabeling it as a referral fee or data charge.

6. Implementation Control C - Data Rights & Source Licensing

Every connector receives a **Data Rights Record** before production activation. 'Publicly accessible' does not automatically mean scrapeable, redistributable, retainable or commercially reusable.

Data Rights Field	Required Record
Source Owner	Agency/vendor/court/provider.
Terms URL / Contract ID	Authoritative governing terms.
Permitted Purpose	Internal research, client service, analytics, acquisition, etc.
Automation Rights	API, bulk, browser automation, manual-only or prohibited.
Commercial Use	Allowed/restricted/prohibited.
Downstream Sharing	What may be shown to partners, attorneys, claimants or third parties.
Resale / Redistribution	Whether raw or derived data may be sold/shared.
Retention	Permitted retention period and deletion obligations.
Attribution	Required source attribution/notices.
Rate Limits	Technical and contractual limits.
Sensitive Fields	Fields requiring masking or restricted roles.
Derived Data Rights	Whether NOVAR may create scores, graphs, reports or analytics from the data.
Audit Rights	Provider audit/logging requirements.
Geographic Scope	States/counties/courts covered.
Effective / Renewal Dates	Contract/terms lifecycle.
Owner	Novar staff member accountable for the connector.
Legal/Data Review	Approver and review date.

6.1 Connector Enforcement

- Connector SDK reads the Data Rights Record before each use.
- Partner-facing APIs filter or transform source data according to downstream-sharing rights.
- Retention jobs delete or archive records according to contractual/legal requirements.
- Exports honor attribution and redistribution restrictions.
- Guardian AI alerts when terms, API behavior, authentication or source schema changes.
- A connector automatically moves to QUARANTINED if its rights record expires without renewal or review.

7. Implementation Control D - Identity, Ownership & Heirship Risk

AI is a research and ranking tool. It is explicitly prohibited from making final legal determinations of title, heirship, entitlement or ownership.

7.1 Mandatory Status Labels

Label	Meaning
CANDIDATE MATCH	Possible identity/asset relationship; unverified.
CORROBORATED	Multiple consistent data points support the relationship.
RECORD VERIFIED	Authoritative records support the factual connection.

Label	Meaning
PROFESSIONALLY VERIFIED	Attorney/title/probate or other qualified review completed where required.
LEGAL DETERMINATION	Only displayed when supported by appropriate legal process or professional conclusion; AI cannot assign this status.

7.2 UI Rules

- Never display 'Owner' when the system only has a probable match; use 'Potential Owner' or 'Record Owner' with source context.
- Never display 'Heir' based solely on AI inference; use 'Probable Heir Candidate' until legally verified.
- Show confidence, evidence count and unresolved contradictions.
- High-dollar actions require a verification checklist and human approval.
- Contracts, claims, deeds, assignments and payouts remain blocked until the required verification state is reached.

7.3 Evidence Decision Trail

Every significant relationship stores evidence objects, contradicting evidence, confidence calculation, reviewer actions, dates and the exact status transitions. Deleted/overwritten evidence is not permitted without a retained audit record.

8. Implementation Control E - Sensitive-Data Security from Day One

Security is a Phase 0/Phase 1 dependency, not an enterprise-hardening feature deferred until the end.

Control Domain	Mandatory Day-One Requirements
Authorization	Least privilege, MFA, role + organization + territory + opportunity-lock + sensitivity controls.
Segregation	Separate Novar master, partner, attorney and owner/heir views; server-side authorization on every query.
Encryption	TLS in transit; encrypted storage; field-level encryption/tokenization for high-risk identifiers.
Secrets	Managed secrets; no hardcoded credentials; rotation and scoped service identities.
Logging	Immutable access/change/export/payment/approval logs.
Retention	Data-class retention schedules, legal holds and deletion jobs.
Incident Response	Severity model, containment playbooks, notification responsibilities and evidence preservation.
Vendor Controls	Security/privacy/data-use review before any third-party integration.
Backups	Encrypted backups, restore testing and separation from primary environment.
Payments	Step-up verification, dual approval for material changes and separate financial roles.
Secure SDLC	Code review, dependency scanning, vulnerability management and environment separation.
Testing	Authorization tests, penetration tests, data-leakage tests and partner-isolation tests.

8.1 Data Classification

Class	Examples	Default Handling
Restricted	SSNs, bank details, IDs, sensitive claimant data	Field encryption, need-to-know, no broad export, enhanced logging.
Confidential	Estate/legal files, proprietary opportunity data, source-controlled content	Role/lock controlled, watermarking, audited sharing.
Internal	Operational analytics, non-sensitive business records	Novar workforce access by role.
Partner Limited	Assigned opportunity facts approved for downstream sharing	Only assigned organization/user.
Public/Source	Public information that the license permits NOVAR to redistribute	Still subject to source terms and provenance.

9. Implementation Control F - Partner Conflict & Circumvention Protection

No single lock feature is sufficient. Protection is implemented as a layered control system spanning contracts, authorization, data presentation, audit, workflow and economics.

9.1 Layered Protection Stack

- **Opportunity Lock:** one active partner unless Novar creates a collaborative deal.
- **Entity Suppression:** suppress linked person, estate, parcel, business and address records to prevent alternate-search circumvention.
- **Territory/Seat Rules:** partner eligibility by state and approved category.
- **Watermarked Evidence:** partner-visible reports contain user/org/case identifiers where appropriate.
- **Controlled Exports:** no unrestricted master-data export; high-volume exports blocked/reviewed.
- **Audit Logs:** search, view, download, print, copy/export attempts and assignment events.

- **Contractual Assignment Terms:** confidentiality, non-circumvention, permitted use and consequences defined in partner agreements.
- **Milestone-Based Exclusivity:** assignments continue only if the partner performs required actions.
- **Reassignment Workflow:** expired/non-performing cases return to Novar before any second partner gains access.
- **Collision AI:** detects duplicate outreach, related-case overlap and cross-partner attempts.
- **Economic Fingerprint:** opportunity ID and deal-economics record persist even if the partner enters related data under another label.
- **Novar Override:** authorized executives can freeze, reassign or convert to collaboration with full audit trail.

9.2 Assignment State Machine

State	Visibility / Action
NOVAR_HOLD	Internal only.
AVAILABLE	Eligible for allocation; optional limited teaser.
RESERVED	One partner may evaluate for a limited period.
ASSIGNED	Exclusive partner assigned.
ACTIVE	Milestones satisfied; lock continues.
AT_RISK	Milestones overdue; warnings and cure period.
RECLAIMED	Returned to Novar due to expiration/breach/nonperformance.
COLLABORATIVE	Multiple parties only by explicit Novar authorization.
CLOSED	Completed and permanently closed.

10. AI Hierarchy

AI	Scope
NOVAR Command AI™	Full national visibility and executive decision support.
NOVAR Guardian AI™	24/7 platform, connector, security, queue, backup and billing health.
Master Orchestrator	Coordinates sweeps, specialist agents and retries.
Competitive Capability Agent	Tracks public competitor capabilities; recommends lawful build/license/integrate responses.
Quality-Control AI	Independently challenges high-dollar findings.
Collision AI	Detects overlapping partner work and circumvention attempts.
Partner AI™	One isolated assistant per partner, limited to authorized opportunity data.
Owner/Heir Assistant	Secure document/status assistant; no proprietary master intelligence.

11. Specialist Agents

Agent	Responsibility
Identity Agent	Entity resolution and false-merge prevention.
National Sweep Agent	50-state, D.C. and federal orchestration.
Property Agent	Parcels, ownership, taxes, liens, equity and acquisition.
Estate Agent	Decedent/probate discovery and estate case creation.

Agent	Responsibility
Heir Agent	Probable family/claimant graph; cannot determine heirship.
Unclaimed Asset Agent	Approved state-held asset discovery.
Bankruptcy Agent	Bankruptcy unclaimed-fund workflows.
Court Funds Agent	Court registries/excess proceeds.
Federal Agent	Approved federal programs.
Mineral/Royalty Agent	Potential mineral/royalty interests.
Business Agent	Historical entities and successor relationships.
Compliance Agent	Applies approved legal rules; cannot create law.
Valuation Agent	Asset/equity/cost estimates.
Strategy Agent	RECOVER / ACQUIRE / PARTNER / RELEASE / WATCH / REJECT.
Allocation Agent	Partner eligibility/capacity/performance routing.
Deadline Agent	Statutory, probate, foreclosure, assignment and partner deadlines.
Fraud/Risk Agent	Claimant/document/payment anomalies.
Report Agent	Evidence-linked reports.
Source ROI Agent	Connector cost/quality/closed-value analytics.

12. NOVAR Guardian AI™

- Monitor application/API health, databases, queues and background jobs.
- Monitor connector authentication, schema changes, source terms review dates, rate limits and stale feeds.
- Detect failed/incomplete national sweeps and perform safe retries.
- Verify backup completion and scheduled restores.
- Detect security anomalies, mass exports, account sharing and cross-partner access attempts.
- Monitor deal-collision events, milestone failures, legal-review queues and deadline risk.
- Alert on expired legal memoranda, rule versions or source-rights records.
- Alert on partner subscription/payment failures.
- Self-heal only approved technical failures; never alter legal rules, entitlement status, payout economics or attorney decisions.

13. National Sweep & Asset Graph

The system begins from a person, estate, business, property, case or known asset and coordinates every approved relevant source. Results are normalized and fused into the NOVAR Asset Graph™.

- Persons, aliases, addresses, contacts where lawfully sourced, deceased status and relationships.
- Estates, probate records, representatives and probable heir candidates.
- Real estate, parcels, deeds, taxes, liens, mortgages, judgments and equity.
- State unclaimed funds, eligible bankruptcy/court/federal funds.
- Mineral/royalty candidates.
- Businesses, officers, ownership interests and successor entities.
- Every finding stores provenance, rights class, retrieval date, confidence and downstream-use restrictions.

14. NOVAR First Look™, Opportunity Watch & Allocation

Every material opportunity reaches Novar first. Novar chooses KEEP, PARTNER, RELEASE, WATCH or REJECT. WATCH opportunities remain under automated monitoring until an approved trigger changes their status.

When PARTNER/RELEASE is selected, the Allocation Agent evaluates only eligible partners based on state seat, asset specialization, capacity, compliance standing, capital/readiness, historical performance and conflict checks. It does not show the opportunity to all eligible partners.

15. Partner AI & Portal

- Authorized portfolio only.
- Evidence-aware Q&A; over assigned case data.
- Next-best-action and milestone reminders.
- Document and attorney-review status.
- Approved communications preparation where permitted.
- Projected partner economics for approved compensation model only.
- No access to master source inventory, unreleased deals, other partners' cases, hidden Novar strategy or source-contract terms.

16. Integrated Attorney Network

- Coverage map by jurisdiction, license and matter type.
- Conflict check before legal case material is released.
- Attorney review queue, governing memo/rule, evidence, documents, deadlines and approval history.
- Legal fees segregated from Novar/partner economics.
- Legal template versions linked to cases.
- Attorney/compliance approval required for rule publication where Novar policy requires it.

17. Source Permission Classes

Class	Meaning
A - Official API	Automated use under approved terms.
B - Bulk Dataset	Approved bulk import.
C - Permitted Automated Search	Automation within terms/rate limits.
D - Human Research	Manual task; no prohibited automation.
E - Authorization Required	Owner/client authorization or required identifiers first.
F - Restricted	Use only under documented conditions.
G - Prohibited	No use/automation.

18. Financial & Ledger Separation

Ledger	Purpose
Asset / Transaction Value	Gross recovered/purchased/realized value.
Owner / Heir Distribution	Amounts payable to entitled parties.
Novar Revenue	Permitted Novar business revenue/economic participation.
Partner Distribution	Approved partner share for the selected compensation model.
Attorney Fees	Separate legal-services accounting.
Third-Party Costs	Title, filing, research, court, notary and payment costs.
Subscription Revenue	Partner membership billing.
Tax Reporting	Applicable vendor/partner documentation/reporting.

19. Core Technical Architecture

- **Frontend:** separate role-aware shells for Novar, partners, attorneys and owners/heirs.
- **Authorization service:** central server-side policy engine enforcing role + organization + territory + opportunity + data-rights + sensitivity.
- **API layer:** versioned service boundary; no direct client access to master database.
- **Workflow engine:** durable long-running sweeps, retries, deadlines and approvals.
- **Relational store:** users, cases, compliance, financial and transactional records.
- **Graph layer:** relationships among persons, estates, businesses, assets and evidence.
- **Encrypted object storage:** source evidence and case documents.
- **Search index:** permission-filtered entity/full-text search.
- **AI gateway:** model abstraction, tool permissions, structured outputs, prompt/model versions, evaluations and cost controls.
- **Connector framework:** Data Rights Record, legal/source permission class, auth, rate limits and health checks.
- **Observability:** logs, metrics, traces, Guardian alerts and security events.

20. Core Data Objects - Expanded

Organizations; Users; Roles; Permissions; Subscribers; PartnerAgreements; Territories; Persons; Aliases; Addresses; Relationships; Deaths; Estates; ProbateCases; Businesses; OwnershipInterests; Properties; Parcels; Deeds; Taxes; Liens; Mortgages; Valuations; UnclaimedAssets; BankruptcyFunds; CourtFunds; FederalAssets; MineralInterests; Opportunities; Scores; Locks; Allocations; Milestones; Sources; SourcePermissions; DataRightsRecords; SourceContracts; Connectors; SearchRuns; SearchResults; Evidence; Contradictions; VerificationStates; Cases; Claims; Acquisitions; DealRooms; Tasks; Communications; Documents; LegalMemoranda; LegalIssues; Authorities; ComplianceRules; RuleVersions; AttorneyReviews; CompensationModels; CompensationApprovals; LegalTemplates; Subscriptions; Invoices; Payments; DealEconomics; LedgerEntries; Distributions; AuditLogs; SecurityEvents; AgentRuns; HealthChecks; Incidents; RetentionPolicies; ExportEvents; ConflictChecks.

21. Required Decision Trails

Decision	Minimum Audit Trail
Identity Merge	Evidence considered, contradictions, confidence, reviewer, date.
Heir/Ownership Status Change	Source evidence, reviewer, legal/professional basis where required.
Legal Rule Publish	Memo version, authorities, reviewer/attorney, test results, effective date.
Compensation Approval	Transaction type, rule version, approver, agreement version.
Connector Activation	Data-rights record, legal/source review, security review, owner.
Opportunity Assignment	Eligibility, conflict check, capacity, lock terms, approver.
Reassignment	Missed milestone/breach/expiration, notices, Novar approval.
Payout	Entitlement verification, compensation model, approvals, account verification.
Security Exception	Reason, scope, approving authority, expiration and review.

22. Full Development Roadmap - Revised

Phase 0 - Governance, Legal & Security Foundation

IP ownership, privacy/security, legal memo schema, compensation model schema, source-rights schema, partner/attorney contracts, threat model, data classification, authorization architecture.

Phase 1 - Identity, Authorization & Audit Core

MFA, organizations, roles, ABAC, immutable audit, persons/entities, aliases, evidence, contradictions, verification states, segregation tests.

Phase 2 - Legal Knowledge & Compensation Engine

LegalMemoranda, authorities, rule extraction/publishing workflow, versioning, kill switch, transaction-specific compensation models and payment guards.

Phase 3 - Source Rights & Connector SDK

Data Rights Records, source contracts, retention/downstream-sharing enforcement, connector permission classes, rate limits, terms expiry/quarantine.

Phase 4 - National Sweep & Asset Graph

Orchestration, dedupe, confidence, provenance, graph, national coverage and source-right-aware result handling.

Phase 5 - Unclaimed Property Discovery

State discovery under approved source/legal workflows; normalization, match scoring and monitoring.

Phase 6 - Texas Deep Pilot

Property/tax/probate workflow validation with full legal/data-rights/security controls.

Phase 7 - Estate & Heir Intelligence

Estate sweep, probable relationships, verification-state UI, owner/heir portal and professional-review gates.

Phase 8 - Bankruptcy/Court/Federal

Approved federal and court workflows with source-specific legal/data rights.

Phase 9 - Property Acquisition / Title Intelligence

Title-risk packet, liens/equity, acquisition economics and legal/professional review gates.

Phase 10 - Minerals & Business Assets

Potential mineral interests and historical business relationships with source/verification controls.

Phase 11 - 50-State Legal Memo Expansion

Asset/workflow memoranda, approved rule versions, state activation gates and attorney network coverage.

Phase 12 - Novar First Look & Strategy

KEEP/PARTNER/RELEASE/WATCH/REJECT and internal capacity analysis.

Phase 13 - 100-Partner Network

Two seats/state, $10K configurable subscription, waitlists, performance/capacity model and partner agreements.

Phase 14 - Conflict/Circumvention Controls

Locks, entity suppression, watermarking, exports, audit, milestones, reclaim/reassignment and Collision AI.

Phase 15 - Partner AI Assistants

Isolated assistant per partner with server-side scoped retrieval and action permissions.

Phase 16 - Attorney Network & Legal Documents

Conflict checks, attorney portal, template versions, filings and privileged/legal workflow controls.

Phase 17 - Finance & Compensation Execution

Subscriptions, approved 60/40 where lawful, componentized economics, legal-fee separation, payouts and reconciliation.

Phase 18 - Guardian AI & Reliability

Health, source rights expiry, legal-rule expiry, failed jobs, security anomalies, backups, incidents and executive health reports.

Phase 19 - Opportunity Watch

Trigger-based monitoring and automatic return to First Look.

Phase 20 - Fraud/QC Hardening

Independent QC, claimant fraud, document anomalies, dual payout approvals and high-risk case holds.

Phase 21 - National Deep-Connector Expansion

State/county expansion only as legal memo + data rights + security + attorney gates are satisfied.

Phase 22 - Enterprise Assurance

Pen tests, SOC 2 readiness, DR exercises, vendor risk, privacy impact assessments, incident response and scale testing.

Phase 23 - Optimization & Competitive Beyond

Outcome-based scoring, source ROI, partner routing optimization and continuous public competitive capability review.

23. Definition of Done for Any New State / Asset Workflow

- Current legal memorandum completed for the exact asset/workflow.
- Production compliance rule mapped to the memo and versioned.
- Approved compensation model identified.
- All relevant source connectors have current Data Rights Records.
- Security/data-classification review completed.
- Attorney coverage exists where needed.
- Verification-status requirements defined.
- Partner visibility/export rules tested.
- Collision/reassignment rules tested.
- Audit trail verified.
- Operational runbook and Guardian monitoring active.
- Product owner + compliance/legal sign-off complete.

24. What Must Never Be Automated Without Human/Professional Approval

- Final legal determination of heirship, title, ownership or entitlement.
- Publication of a new legal rule to production.
- Changing a statutory/regulated fee cap.
- Executing or filing legal documents where professional review is required.
- High-risk payout or bank-account change without required verification.

- Overriding a partner lock or reassigning a disputed opportunity without authorized Novar review.
- Using a source beyond documented license/terms permissions.

25. Final Governing Principles

Legal: every state/asset/workflow is separately analyzed and versioned.

Economics: 60/40 is a business target, not a universal legal rule.

Data: every connector is governed by documented rights, retention and downstream-use controls.

AI: probabilistic intelligence cannot become a legal conclusion without required verification.

Security: authorization, encryption, segregation, logging, retention and incident response begin at the foundation.

Partners: exclusivity is enforced by architecture + contracts + audit + workflow, not by a single lock field.

Novar: Novar owns the intelligence, sees opportunities first and controls allocation of released opportunities.

END OF VERSION 1.1 IMPLEMENTATION CONTROL EDITION

NOVAR Asset Intelligence Implementation Addendum

Version 1.3 | September 30 2026 | Controlled implementation specification

This addendum supplies the policies, operating procedures, data contracts and acceptance evidence needed to implement the Version 1.2 consolidated master blueprint. The complete 21-page Version 1.2 blueprint is preserved in Part I. Part II adds the numbered sections requested by leadership, ten operating appendices and executable contract forms. Section numbers are insertion references to the base blueprint; they are not a replacement roadmap.

Status: proposed control baseline for adoption. This document does not certify that entities have been formed, licenses issued, insurance bound, sources licensed, vendors contracted or counsel approvals obtained. Those facts must be established through evidence. Numerical limits are NOVAR policy defaults, not statements of statutory thresholds. A stricter law, signed source restriction or approved legal memorandum controls. Missing or conflicting authority blocks the affected action.

Upon adoption, MUST, SHALL and PROHIBITED are mandatory. Every enabled production action must have a current approval bundle containing entity, jurisdiction, asset type, workflow, legal memorandum, rule version, source rights, privacy assessment, security review, contract versions and permitted funds-flow path. The enforcement service rechecks the bundle at action time; an earlier case approval does not bypass an expired control.

Amendment precedence and control ownership

Version 1.3 controls implementation detail where it expressly expands Version 1.2. Version 1.2 continuous discovery remains controlling over weekly internal-sweep assumptions. Base Sections 4, 5, 6, 7, 23 and 24 remain mandatory. No addendum default authorizes prohibited source access, final AI legal determinations or a universal 60/40 split.

All acceptance records use: gate_id; scope; control_version; owner_user_id; evidence_uri and SHA-256; test_run_id; reviewer_id; result PASS/FAIL/BLOCKED; approved_at; expires_at; dependencies; exceptions; revocation_reason. An approval expires at the earliest dependency expiry. Evidence is stored in a restricted, versioned approval repository. A risk exception cannot waive a legal requirement, tenant separation, source right, entitlement review, sanctions hold or two-person payment control.

Accountable roles: Executive sponsor; Legal lead (qualified outside counsel where needed); Compliance lead; Privacy lead; Security lead; Engineering lead; Product lead; Operations lead; Finance controller; independent payment approver. A named person may hold several roles except where separation of duties is required. No person may approve their own payout preparation, bank change, production legal-rule publication or access exception. Lack of a second qualified person is a block, not an exception.

Navigation and delivery structure

Part I preserves the source blueprint. Part II contains Sections 0A, 6A, 6B, 7A, 18A, 9A, 16A, 19B, 19C, 20B, 17A, 13B, 10A, 12B and 22B. Appendices A-J correspond to the ten requested templates. Appendix K contains partner, attorney, source and vendor contract forms plus claimant agreement controls. Appendix L lists official references and unresolved launch decisions.

Minimum build gates before production data development

Synthetic-data UI prototypes may begin immediately. Engineering that retrieves production sources, processes real personal data or activates external users requires gates B1-B8. These gates are independent of the later production release committee.

Gate	Required package	Owner and evidence
B1	Permissions and tenant isolation	Security + Engineering; approved role matrix; policy tests; tenant-aware DB/search/vector/object designs
B2	Data model and transitions	Engineering + Product; versioned schemas; migration plan; state transition tests; reconciliation invariants
B3	Connector certification	Compliance + Operations; exact source/rights/delta/reconciliation/failure packet; kill-switch proof
B4	Privacy and records	Privacy + Legal; inventory; notices; rights workflow; retention resolver; hold and deletion tests
B5	Verification and money controls	Operations + Finance + Legal; fraud rules; sanctions provider; bank-change and dual-control tests
B6	Texas charter	Release committee; one asset/workflow; approved source; population and exposure caps; signed coverage
B7	AI controls	Product + Security; allowed agent tools/models; redacted data paths; evaluation results; review routing
B8	Contracts and entity authority	Legal + Finance; entity evidence; source/DPA/partner/attorney templates approved and executed as applicable

Section 0A Entity Licensing and Contracting Architecture

0A.1 Entity map and assignment of responsibility

The source blueprint names NOVAR Development Group but supplies no incorporation certificates, EINs, assumed-name filings, subsidiary ownership documents or banking evidence. The entity design below uses functional IDs until counsel verifies exact legal names. It is the required operating allocation, not a claim that additional entities already exist. A trade name, product name or portal tenant is not a separate legal entity.

Entity role	Purpose and authority	Formation and launch treatment
ENT-OP Operating company	Employs staff; operates platform; signs source, partner, claimant service and vendor contracts; pays operating vendors; receives subscriptions and approved service revenue	Select the verified existing NOVAR corporation, using its exact certificate name; counsel and controller resolve all alternate NOVAR names before signing
ENT-IP IP owner	Owns assigned code, brands, domain accounts, documentation and permitted proprietary models; licenses use to ENT-OP	Default pilot: ENT-IP = ENT-OP; separate IP company only after board approval, formation and executed intercompany license
ENT-SPV Transaction company	Holds a specifically approved acquisition, financing or JV interest; receives only its transaction proceeds; pays its vendors	Not used in the pilot; each future SPV separately formed, registered, insured and approved before a transaction
EXT-CUST Independent custodian	Approved bank, escrow/title company or attorney trust account holder handles owner proceeds when legally appropriate	Not a NOVAR entity; due diligence, licensing and contract required; no NOVAR custody in initial pilot
EXT-LAW Law firm	Provides legal services to the expressly identified client; receives its legal fees	Independent engagement; no platform-created attorney-client relationship

ENT-OP owns IP during the pilot, employs staff, signs source and partner agreements, contracts with owners for approved nonlegal service, pays vendors and receives NOVAR revenue. ENT-OP makes shareholder distributions only after controller reconciliation, tax review, board authorization and applicable corporate-law solvency review. Partner commercial distributions are approved contractual payables, not shareholder distributions. A future ENT-IP receives only documented royalties; a future ENT-SPV distributes under its signed operating/JV agreement. No cross-entity transfer without a purpose, intercompany agreement, ledger entry and approval. Source licenses may not transfer to a new entity without source consent when required.

Entity evidence record: exact_name; formation_state; entity_type; filing_number; EIN vault reference; registered_agent; registered_office; ownership/cap_table; governing_documents; authorized_signers; bank_account_tokens; tax_status; good_standing_check; IP_assignments; intercompany_agreements;

effective_date; legal_approval_id. Verify standing at onboarding, annually and before material financing/acquisition. Employee and contractor IP/confidentiality assignments precede access to code or source data.

0A.2 Registration and license tracker

Maintain one row per entity + jurisdiction + activity. Fields: activity_description; customer/asset location; employee location; registration_trigger; regulator; primary_authority; counsel_memo_version; status REQUIRED/NOT_REQUIRED/PENDING/EXPIRED; filing/license number; scope; qualifier; bond; insurance; renewal deadline; evidence; owner; approval. NOT_REQUIRED requires a reasoned counsel finding and review date; blank means blocked. State foreign qualification, assumed names, tax registrations and municipal/county business requirements are evaluated separately. Track all 50 states, D.C. and relevant federal scopes; only approved rows may be enabled.

Activity trigger	Mandatory review and operating block
Locator or recovery service	Evaluate asset-specific registration, waiting periods, contract form, fee caps, solicitation and assignment limits before outreach or contract
Collecting money owed for another	Debt-collection classification, state licensing/bonding and federal/state consumer rules; no collection activity until cleared
Buying, negotiating or marketing property	Distinguish own-account acquisition from brokerage/agency; evaluate real-estate license, appraisal, disclosure and foreclosure-rescue rules
Introducing legal clients or charging referrals	Attorney advertising, referral service, unauthorized practice and professional fee-sharing analysis; no paid legal referrals without express clearance
Holding or directing others' money	State money transmission, FinCEN/MSB, custody, escrow and trust analysis; a provider integration is not an automatic exemption
Title examination, insurance or escrow	Approved licensed professionals only where required; platform findings do not constitute insured title or professional opinions
Sharing personal-data intelligence	Data-broker definitions, registration, notices, deletion obligations and permissible use evaluated per jurisdiction

Texas initial legal memo must expressly address Property Code Section 74.507 recovery agreements, if used. That provision includes a 10% recovery-service fee limitation with a separate treatment for reasonable necessary attorney fees; it is not authority to split gross claimant proceeds 60/40. Counsel must validate applicability, current text and all agreement conditions before release. [R1]

0A.3 Contract authority matrix

Contract or action	Contracting party	Required approvals	Authorized executor
Source rights or license	ENT-OP; ENT-IP only if named licensee	Source owner + Compliance + Legal; Security for integration	Board-delegated ENT-OP officer
Partner subscription and assignment	ENT-OP	Legal-approved form + Operations eligibility + Finance economics	Delegated commercial officer within written limit
Claimant assistance agreement	ENT-OP	Exact workflow legal approval + verified authority + compensation approval	Delegated officer and claimant/representative
Employee or contractor	ENT-OP	HR/Operations + Legal IP terms + Finance budget	Authorized officer
Vendor/DPA	ENT-OP	Security + Privacy + Legal + Finance	Authorized procurement officer
Attorney engagement	Named client: ENT-OP or owner/partner	Conflict clearance + client consent + fee routing	Named client; ENT-OP cannot bind another client
Acquisition/JV	Approved ENT-SPV or ENT-OP	Legal + Finance + board; licenses/title/escrow as applicable	Recorded entity signatory
Distributions or intercompany payment	Owing legal entity	Controller + independent approver + board when required	Bank signer separate from preparer

Maintain dollar delegations: operating contracts up to $10,000 total commitment need budget owner and controller; above $10,000 need executive sponsor; above $50,000 or any financing, guarantee, acquisition, exclusivity or IP transfer need board approval. These limits do not waive Legal/Security/Privacy review. Contract signing is unavailable when entity standing, authority or applicable license evidence is missing.

0A.4 Insurance and do not operate rule

Pilot procurement floors: cyber/privacy liability $2 million aggregate; technology/research E&O $1 million per claim/$2 million aggregate where the service is insurable; D&O $1 million; crime/fidelity $1 million including social engineering and funds-transfer fraud where available. Broker and counsel must confirm actual policy coverage, exclusions, retroactive dates and claims-made tail needs. Mandatory statutory coverage/bonds override floors; workers compensation and general liability are reviewed for staffing and premises. A certificate alone is not evidence of every exclusion or endorsement.

High-risk vendors carry cyber $2 million and professional liability $1 million; counsel engaged on matters carries malpractice $1 million per claim/$2 million aggregate or a documented higher-risk requirement. Obtain declarations, relevant endorsements, carrier and policy period; review annually and at renewal; alert 60/30/7 days before expiry. A lower commercial limit requires written risk approval and coverage rationale, but statutory coverage cannot be waived.

DO NOT OPERATE: deny the affected jurisdiction/workflow action if classification, entity standing, registration, license/qualifier/bond, required insurance, source rights or counsel sign-off is incomplete, expired or revoked. Discovery itself requires approved discovery rights and privacy scope. The system returns a reason code and remediation owner; staff may not use manual workarounds. Acceptance evidence: signed entity map, state-registration and license trackers, signer matrix, IP chain, insurance evidence and scope-specific legal approval; demonstrate expiry immediately disables outreach, assignment, contracting and payments.

Section 6A Privacy Consumer Rights and Data Governance

6A.1 Inventory and purpose controls

Privacy owns the processing inventory. Each field has category, source, subject type, direct/derived/inferred status, purpose IDs, lawful authority/consent condition, sensitivity, recipients, geography, retention rule, model-use flag, deletion path and accountable service. Inventory includes source imports, graph inferences, prompts, embeddings, fraud scores, case documents, screenshots, logs, support tickets and payment tokens. No collection with an undefined purpose.

Data category	Approved purposes	Recipients and limits
Names, aliases, historic addresses, asset records	Discovery, corroboration, approved outreach, case administration	Research staff; scoped partner projection only after rights and assignment gates
Inferred family/entity links and match scores	Candidate ranking and verification review	Restricted research/reviewer access; label inference; no inferred heirship disclosure in unsolicited outreach
IDs, DOB and verification evidence	Identity/authority verification and fraud review	Verification team/vendor; token or result to other roles; no routine partner export
Bank details and payment evidence	Account ownership, payout and reconciliation	Provider vault + Finance; only masked last four/token to platform users
W-9/W-8 and tax information	Payee onboarding and tax reporting	Finance restricted vault; no research, partner assistant or marketing access
Probate, estate, deeds and filings	Approved case legal review and submission	Case-scoped staff/counsel; sealed/restricted records not imported without authority
Contacts, consent and preferences	Approved notices, support and opt-out suppression	Outreach service receives minimum fields; suppression applied globally
Usage, security, access/export and audit records	Security, controls, support and approved aggregated analytics	Security/audit roles; no secondary prospecting

Purpose IDs: DISCOVERY; VERIFY; OUTREACH; CASE_ADMIN; PARTNER_ACCESS; LEGAL_REVIEW; PAYMENT; TAX_REPORT; SECURITY; SUPPORT; AGGREGATE_ANALYTICS; APPROVED_MODEL_INFERENCE. Data access requires a listed purpose and valid rights; collection for recovery does not authorize advertising, unrelated products or model training. Fine-tuning on personal/case data is prohibited by default. Model use is further restricted by Section 10A.

6A.2 Notices and consent records

Publish a versioned public privacy notice and point-of-collection notice covering exact entity/contact, categories and sources, purposes, recipient classes, sale/sharing classification, retention criteria, rights and appeals, verification method and contact route. Insert a separate sensitive-data notice/consent where legally required. A notice change requiring new consent blocks new processing until consent is obtained. Never claim data is not sold/shared until Legal evaluates paid intelligence access and applicable definitions.

Notice template: "[Exact entity] processes [categories] obtained from [source classes] for [enumerated purposes]. We provide [recipient classes] the information needed for [specific tasks], subject to access restrictions. Retention follows [published criteria]. You may request [applicable rights] through [secure URL/email/postal address]. We verify requests proportionately. Contact [privacy contact] to appeal or ask questions. [Jurisdiction disclosures and broker notice, if applicable]." All bracketed fields must be completed and approved before publication.

Outreach disclosure template: "We are [exact entity], a private company, not a government agency. Approved records indicate a possible connection to [minimum asset description]. This is not a finding that you are entitled to payment. You may contact the official agency directly [official route]. Our optional service and any lawful fee are described in [approved agreement]. To stop messages use [method]." Do not expose another person's records, estate relationships, ID, precise account value or legal conclusion in an unsolicited message.

Consent/preference record: subject_id; channel; destination_token; purpose; notice_version; consent_text_hash; affirmative_action; collected_at; collector; expiration; withdrawn_at; suppression_reason; evidence. Pre-send checks include channel permission, legal outreach window, do-not-contact lists, assignment, current template and frequency cap. Default cap: two approved attempts in 30 days absent a response; stop immediately on opt-out. SMS/autodialed/recorded calls are disabled in pilot; no inferred consent. Transactional notices are separately classified and minimum-content only.

6A.3 Rights request operating procedure

Provide secure form, dedicated privacy mailbox and postal route; actual addresses are release blockers until populated. Log a request within one business day; acknowledge within five business days; determine jurisdiction and applicable access, correction, deletion, portability, opt-out and appeal rules. Set the statutory deadline from the approved rights-rule version. Internal target is 30 calendar days, with any shorter legal deadline controlling. Do not use the target to lengthen a legal deadline.

Verify proportionately using existing account proof or case identifiers; do not demand unnecessary ID. Authorized-agent proof is separately checked. Apply opt-out suppression within 24 hours while identity issues are reviewed when legally appropriate. Search relational, graph, object, search, vector, vendor and backup inventories. Access exports must redact other subjects and privileged material. Corrections preserve source facts and add an annotated dispute/correction layer; do not falsify official records. Deletions use Section 6B and propagate to processors. Any exception cites its legal basis, scope and expiry; Legal approves denials and holds.

Return determination and secure export/deletion confirmation; notify processors and record acknowledgments. Route appeal to an independent Privacy/Legal reviewer, target 30 days, subject to applicable statutory limits and regulator-information requirements. Reopen correction impacts on scores, cases and outreach. Monthly metrics: requests by right, overdue count (target zero), median

completion, denials/appeals, vendor failures and unauthorized disclosure count (target zero).

6A.4 Sensitive data vendors and geography

IDs, full tax IDs, bank data and tax forms remain in segregated encrypted vaults; mask by default. No sensitive attachments by ordinary email, support chat, spreadsheets or external AI. Avoid retaining biometrics; no biometric verification vendor until separate consent/law analysis and deletion controls are approved. Restrict inferred relationship data and information about children; no minors in pilot and no child profiling. Probate records may contain living-person data and sealed material; public availability does not remove all handling restrictions.

Before monetized partner access, Legal completes a data-broker determination for each jurisdiction and receiving market. Texas SOS currently identifies Chapter 510, registration, notice and security-program requirements; do not rely on older references to Chapter 509 without checking current law. [R2] California and any other implicated jurisdiction require their own current review; Texas clearance is not national clearance.

Each processor signs Appendix K DPA before transfer. Subprocessor register: legal name, function, categories, locations including support, security evidence, onward-transfer terms, retention, notice date, approval and deletion attestation. A vendor may not reuse data for advertising or training. New subprocessors require 30-day notice where contractually possible; unresolved material objection blocks the transfer.

Pilot production data, backups, keys and AI processing stay in approved U.S. regions. Access from outside the U.S. is denied, including remote support. Later exceptions require country-specific legal/privacy/sanctions review, source permission, transfer terms and Security approval; U.S. hosting alone does not authorize foreign remote access. Acceptance: full inventory, notices/consent versions, processor list/DPAs, rights request drill, broker determination and geography access tests.

Section 6B Records Retention Deletion and Legal Hold

6B.1 Retention schedule and resolver

These are baseline policy periods, not universal legal mandates. The retention resolver evaluates statutory minimum, source contractual maximum, consent restrictions, legal hold and record purpose. A source maximum that conflicts with required legal retention causes intake/sharing to stop pending counsel resolution; do not silently choose whichever is longer. Applicable approved schedule version is linked to each record.

Class	Baseline period and clock	Disposition and custodian
Raw imports and source snapshots	Raw staging 30 days after validated ingestion; evidentiary snapshots used in a case 7 years after case closure	Source maximum may be shorter; Operations purges staging and archives permitted case evidence
Identity and resolution evidence	Unused candidate data 180 days after last approved activity; case evidence 7 years after closure	Raw ID image deleted within 30 days after verification unless specific need approved; keep minimum result/attestation; Privacy owns
Legal memoranda rules and approvals	10 years after supersession/revocation or last linked case closure, whichever later	Legal archives version and authority; longer regulatory obligation separately configured
Partner assignments and communications	7 years after termination or linked case closure, whichever later	Operations archive; routine unlinked marketing 2 years after last contact
Contracts claims deeds filings and payments	7 years after case closure/contract termination/final settlement, whichever applies; title acquisition instruments permanent while property held plus counsel-approved tail	Legal/Finance archive; tax/audit or other legal minimum overrides
Security access and export logs	90 days searchable plus archive to 1 year after event	Security; incident-associated logs moved to hold/evidence schedule
Business decision audit and ledger logs	7 years after case/transaction closure	Audit/Finance; immutable entries contain references not raw personal documents
Source contracts rights and licensing	7 years after expiry/termination or last dependent case closure, whichever later	Compliance archives permission history and renewal evidence
AI prompts and execution traces	Redacted diagnostic payload 30 days; approval/output evidence linked to a case follows case schedule; model/prompt registry 7 years after retirement	AI owner; no raw ID/bank/tax payload retained

Class	Baseline period and clock	Disposition and custodian
Consent suppression and rights records	Consent evidence 7 years after last use; minimum suppression token retained while needed to honor opt-out, reviewed annually; rights-case evidence 3 years after completion	Privacy; suppression must not repopulate deleted profiles
Backups and disaster recovery copies	35-day rolling backup, unless scoped hold copy required	Engineering; encrypted, no routine queries; deletion tombstones applied before restored data serves traffic

6B.2 Holds and controlled deletion

Legal hold triggers: threatened/actual litigation, subpoena, regulator inquiry, disputed ownership/entitlement, payment or fraud investigation, security incident, source/partner contract dispute, or counsel direction. Staff notify Legal within one business day; urgent preservation is immediate. Hold record includes matter, scope/IDs, custodian, systems, start, authority, counsel owner, access restrictions and review date. Legal acknowledges within one business day and reviews each hold every 90 days. Only Legal releases it in writing. Hold preserves relevant evidence, not unrestricted whole-system access.

Daily expiry job creates a proposed deletion manifest. Privacy approves the applicable schedule and rights disposition; custodian validates scope; Legal checks holds; a separate operator executes. Bulk deletion above 10,000 objects needs Engineering and Privacy second approval. All source-required deletions execute by their deadline. Error blocks completion and opens incident; deletion is never logged successful after partial failure.

Delete relational fields, graph edges, objects and versions, search/vector records, caches, local exports and vendor copies; log per-system count and result. Use cryptographic erasure only where keys exclusively protect the targeted data and replicas are covered. Archive requires encrypted restricted storage, integrity hashes, quarterly access review and documented retrieval approvals. It is not an alternative to required deletion.

Proof-of-deletion certificate: request/batch ID, rule version, object IDs or nonreversible manifest hash, counts, systems, processor confirmations, operator, approver, executed_at, backup expiry, exceptions and hold references. Retain minimum audit certificate without the deleted payload. Monthly drill must prove a deleted subject cannot be retrieved or resurrected by a backup restore; held evidence remains recoverable and access-controlled. Acceptance: populated schedule, conflict resolver tests, hold issue/release drill, deletion and restore test, sample certificate and vendor attestations.

Section 7A Identity Claimant and Bank Account Verification Policy

7A.1 Separate factual status from transaction readiness

The Section 7 identity labels remain intact. Identity assurance, legal authority, sanctions, fraud and bank ownership are independent dimensions. No general VERIFIED flag may authorize contracts or payments. A legal determination about an asset does not prove the identity of the person requesting payout.

Operational tier	Minimum methods and evidence	Permitted next action
V0 Research candidate	Lawful source record; provenance; unmerged contradictions	Internal research only; CANDIDATE or CORROBORATED label
V1 Record connection	Authoritative record plus independent corroborating attribute; reviewer confirms exact match scope	RECORD_VERIFIED fact label; approved low-content outreach only if legal/channel gates pass
V2 Identity and authority	Approved government ID validation or counsel-approved alternative; independent contact/address check; signed authority; fraud review	Claimant onboarding and approved agreement/document collection; no payout
V3 Submission ready	V2 + exact agency-required documentation; entity/estate authority; professional review when required; compensation and sanctions clear	Human-approved submission; label PROFESSIONALLY_VERIFIED only for reviewed scope
V4 Payment ready	V3 or agency-approved entitlement evidence + current bank ownership + fresh sanctions + two approvals + reconciled funds/fee basis	Payment review and release for the exact payee/account/amount

7A.2 Approved methods and vendor admission

Method allowlist: official agency/court/company records; approved ID-document authenticity provider; bank-linked ownership attestation from regulated provider; independently obtained bank confirmation; certified legal documents; manual reviewer alternatives for accessibility. No vendor is presently certified by this document. Vendor registry entries require exact legal provider, method, accuracy/failure data, spoofing controls, DPA, U.S. processing, insurance, accessibility fallback, retention and named approval. Production vendor_id must reference an ACTIVE approved entry; a missing vendor selection blocks V2/V4, while synthetic testing may continue.

Accepted documentation: unexpired government photo ID; source-accepted certified death/estate authority/court orders; current entity formation and signer resolution; source-accepted address/ownership history; bank-issued ownership confirmation or approved provider result. Manual alternatives need documented source acceptance and Compliance approval. Prohibited as sole proof: social-media profile, AI output, unverifiable screenshot, edited document, cash-app display name, self-certified bank ownership, purchased identity profile or inferred family relationship. Staff do not request online-banking passwords, card PINs or email OTPs.

7A.3 Mismatch thresholds and re-verification

Name normalization handles punctuation and documented aliases, not unexplained identity changes. DOB/tax-ID conflict, competing claimants, forged documents or bank owner mismatch causes FRAUD_HOLD. Address mismatch may reflect historic ownership; reviewer links dated evidence and does not silently overwrite. Estate payee requires appointment/authority and account title accepted by counsel/source; entity payee requires good standing and authorized signer. Joint accounts require documented claimant ownership and legal routing approval. Third-party, unrelated or cryptocurrency destinations are prohibited in pilot.

High-dollar default: potential gross asset value at or above $25,000 requires independent QC and attorney/qualified professional review where entitlement/authority is involved; at or above $100,000 also requires Legal lead and executive sponsor. Unknown value treated as high risk until bounded. Actual NOVAR payment thresholds are Section 18A and cannot be evaded by splitting. Complex estates, disputed owners and inconsistent authority trigger escalation regardless of value.

Reverify identity/authority after 12 months, expired evidence, representative change, material correction or suspicious activity; verify source authority at each filing. Bank proof must be within 30 days of first payout and checked on every account change. Sanctions screening is repeated at each Section 18A gate. Case readiness expires independently of record history.

7A.4 Fraud review appeal and evidence

Create FraudReview with reason, risk features, evidence references, reviewer, deadline and hold scope; notify case owner immediately. Operations triages in one business day; escalated fraud reviewed within two business days; no automatic denial from a model score. Route legal entitlement to counsel and technical spoofing to Security. Claimant receives neutral notice and secure appeal route without revealing detection secrets. Independent reviewer acknowledges appeal in five business days and targets decision within 15 business days, subject to controlling legal deadlines. Clearance requires recorded human rationale and all missing evidence; no executive bypass for sanctions or legal authority.

Keep raw IDs and financial documents in vault only, following 6B; partners see checklist completion and minimum masked results. Retain vendor transaction IDs, method, reviewer and scoped conclusions instead of full sensitive documents when possible. Acceptance: tier/action tests; mismatch/estate/entity scenarios; expired-proof block; appeal drill; fraud hold blocks contract/submission/payment paths including API and manual console.

Section 18A Payments AML Sanctions and Funds Flow Controls

18A.1 Permitted funds flow and screening

Pilot funds flow: official asset holder pays the verified claimant directly. Claimant pays only separately contracted, lawful NOVAR service fees to ENT-OP after the approved trigger; any legal fee is paid separately to counsel. ENT-OP may pay ordinary operating vendors and approved partner commercial payables from its own operating funds. NOVAR does not receive, pool, escrow or onward-transmit gross owner recoveries in this pilot. No production claimant-custody feature is enabled.

A later funds-flow design requires a transaction-specific signed diagram showing legal owner, bank/account title, payer/payee, gross/net amounts, fees, custodial responsibilities, provider/license status and reconciliation points. Legal analyzes federal/state MSB, money transmission, escrow and professional trust rules. An AML/SAR filing duty is assessed by activity and regulation; this policy does not assert that NOVAR is a regulated financial institution merely because it screens payments. [R3]

Compliance screens claimant/representative, partner, vendor, attorney and relevant entity owners/controllers against applicable sanctions and restricted-party lists before onboarding, contract execution, assignment and payout. Use approved provider and official-list versions; evaluate OFAC ownership/control rules including blocked ownership aggregation under current guidance. Unresolved potential match blocks the action; only trained Compliance/Legal may clear with documented disambiguation. Confirmed sanctions handling, blocking/rejecting/reporting follows applicable law and counsel/provider instruction; do not return blocked funds as an ordinary refund. Save list version, timestamp, inputs in restricted form, match evidence and decision. [R4]

Screening results used for payout must be less than 24 hours old; rescreen on list update, ownership change or material new information. Active counterparties screened daily through approved batch/provider process. Provider outage blocks new gated actions; no "screen later" mode.

18A.2 Payment approvals and account changes

Payment size or risk	Required controls
All payments	Preparer plus independent Finance approver; verified invoice/payee/account, current screening, approved economics and balanced ledger; bank/provider release enforces second control
$5,000 to less than $25,000	Controller plus independent authorized bank releaser; neither may be preparer; approval binds amount and destination
$25,000 to less than $100,000	Controller + executive sponsor as approvers; Compliance clearance; independent bank release
$100,000 or more; exception-sensitive transaction	Legal lead + controller + executive sponsor; board approval where delegated limit requires it; not allowed in initial pilot
Any bank change fraud alert or ownership dispute	HOLD irrespective of amount; no amount-based override

Threshold uses aggregate payee/case payments over rolling 24 hours; split invoices or batches do not lower approval tier. Approvals bind payment_id, revision, amount, currency, payee, bank token, compensation version and evidence hash. Any change invalidates all approvals. Two-person control must also exist at payment provider/bank, not only in the application.

Account change: accept through authenticated secure portal; require fresh MFA, new ownership proof and independent out-of-band callback using a previously verified number obtained before the request. Never use the number or link supplied in the change email. Record callback method/result, not unnecessary recordings. Notify old verified contact, wait 72 elapsed hours after completed verification, and require second reviewer before enabling payout. During cooling off all pending payments to changed destination remain held. A microdeposit alone is not ownership proof. Initial bank onboarding receives the same ownership/control checks; urgent pressure is a fraud signal.

18A.3 Ledger reconciliation provider responsibilities

Maintain separate ledger accounts for gross asset facts, owner entitlements, NOVAR revenue, partner payable, attorney fee, third-party cost, subscription and tax facts. Ledger separation alone does not justify commingled bank custody. Each entry includes legal entity, account, debit/credit, amount in integer minor units, currency, case, payment, component, rule, evidence and effective/booked dates. Debits equal credits per entity/currency/journal. Corrections are reversing and replacement entries; never update posted amounts. Gross asset values and projections are noncash facts unless an actual transaction makes them accounting entries.

Payment-provider contract defines custody status, licensing, account ownership, settlement timing, sanctions/KYC responsibility, fraud obligations, tokenization, disputes, records, reconciliation data and incident notice. Provider screening does not remove NOVAR's contract or sanctions responsibilities. Use hosted/tokenized collection; no full PAN/CVV storage.

Finance reconciles provider events, bank settlement and ledger daily by next business day; close requires independent sign-off. Suspense differences are investigated within one business day and resolved or escalated within three. Do not recognize disputed/pending receipts as settled cash. Month end controller closes reconciliations within five business days; external accountant reviews material differences. Record bank report hash, provider IDs and unmatched totals. No irreversible provider call without durable idempotency and reconciliation key.

18A.4 Custody disputes suspicious activity and taxes

Escrow/title/attorney trust accounts, if later approved, are owned and administered by the appropriately authorized custodian under separate agreements. NOVAR has no discretionary access to client trust money; request/status integration cannot initiate unapproved transfers. Custodian supplies matter-level balances and independent reconciliations. No netting owner proceeds against subscriptions or attorney fees; no funding expenses from another claimant's recovery.

Disputed payment: place affected receivable/payment on hold; open dispute within one business day; preserve signed contract, verification, delivery and provider evidence; submit response before provider deadline; controller approves resolution. Refunds return to original verified rail/payor unless Legal-approved exception; preparer and independent approver required. Mistaken payment: freeze pending releases, contact bank/provider fraud channel immediately, attempt recall lawfully, notify Legal and preserve evidence; never debit a claimant account without authority. Chargebacks/clawbacks create separate receivable or reversing journal, not hidden edits. Partner clawback requires the contract basis and notice/dispute process.

Suspicious activity: staff notify Compliance through secure incident channel immediately, preserve facts, hold implicated actions and avoid tipping off where prohibited. Compliance evaluates with Legal whether provider notice, law enforcement or regulatory filing is required and who files. Regulated SAR materials, if applicable, are access-restricted and not disclosed improperly; no claim that every internal fraud ticket is a SAR. Record decisions and applicable deadline in the legal rule.

Controller owns W-9/W-8 classification and secure collection before reportable payee payment, taxpayer name/TIN validation through lawful methods, backup-withholding analysis and annual information-reporting calendar. Forms are selected by payee status and current tax rules, not a universal W-9 requirement. Tax advisor approves form/version/thresholds, foreign-payee withholding and filing duties; restricted tax vault stores evidence. Monthly payee data review; year-end reconciliation and independent sign-off before filing; corrections logged. Acceptance: signed funds-flow diagram, screening drills, split-payment tests, account-change/callback test, provider dual-control proof, balanced journal/reconciliation proof, dispute/refund run and tax-owner calendar.

Section 9A Partner Contract and Enforcement Framework

9A.1 Eligibility and onboarding

Operations confirms legal entity, authorized signatory, beneficial ownership where relevant, territory/asset scope, competence, licenses, insurance, sanctions, conflict disclosures, references and documented capacity. Background checks require lawful purpose and consent; evaluate applicable consumer-report requirements before using a reporting vendor. A denial is human reviewed. Training covers source restrictions, identity labels, privacy, approved outreach, conflicts, fraud, exports and complaints; pass assessment at 90% and all critical controls correctly. Refresh annually and on material policy changes. Partner account remains PENDING until signed MSA, subscription order, DPA/data-use terms and eligible coverage evidence are current.

Permitted data use is limited to the assigned workflow for the authorized case during the assignment. Prohibited: reselling, bulk copying, training external models, combining data for unrelated solicitation, contacting unreleased owners, bypassing NOVAR, credential sharing or using another partner's evidence. Confidentiality survives termination. Non-circumvention covers only identified protected opportunities and documented introductions; scope, duration, preexisting-relationship carveout and enforceability require counsel approval. Non-solicitation is disabled unless approved for the jurisdiction and exact restriction. Nothing restricts lawful protected activity or client choice of counsel.

9A.2 Subscription and assignment terms

Default commercial order: configurable target $10,000/month per approved seat; it is not a promise of cases, recovery, returns or regulated fees. Billing in advance on order date; reminder at due date; written delinquency notice at day 3; suspend new assignments and partner exports on day 10 if unpaid; possible termination on day 30 after contractual notice. Do not suspend necessary owner/legal access to prejudice a filing deadline. Reinstatement requires payment resolution, current eligibility and Operations review; assignments are not automatically restored. Refunds follow signed order and controlling law, not discretionary undisclosed rules.

Default assignment: 7-calendar-day RESERVED evaluation; then 30-day ASSIGNED lock. Within two business days acknowledge; within five submit action plan; within ten complete authorized outreach/document milestone or documented blocker; weekly progress report. ACTIVE extends in 30-day increments only after Operations approval and milestone evidence. No implied perpetual exclusivity. One active assignment per opportunity is enforced by a database constraint and serializable allocation transaction. Explicit COLLABORATIVE assignments need named participants, scopes and economics, with separate legal/conflict approval.

Overdue milestone sets risk flag AT_RISK (base blueprint label), sends notice, and starts five-business-day cure unless immediate suspension required for misuse, sanctions, legal expiry or security. Operations assesses cure; Legal reviews contested material breach. Reclaim invalidates access/lock, preserves work/evidence and notifies counsel/case owner to protect deadlines. Reassignment requires new conflict/capacity checks and signed packet. Dispute submitted within ten business days goes to Operations then independent Legal review; preserve the case and suspend disputed economic release. Post-termination provide complete case handoff within two business days, delete authorized copies within ten days except lawful holds, return credentials and certify deletion; accrued lawful fees and client rights are addressed by the contract.

9A.3 Economics evidence and remedies

Assignment packet specifies compensation component, legal-rule version, fee basis, caps, approved 60/40 only where lawful, cost responsibility, preapproval limits, taxes, settlement trigger, refunds and clawback basis. No percentage may be calculated from attorney fees or owner gross proceeds where not permitted. No guarantees of asset value, outcome or availability. Partner pays its taxes and unapproved expenses; owner costs require separately disclosed lawful approval.

All exports are default-denied and require rights/purpose/case approval; use per-user/case/time watermark, export_id, source attribution and expiry. Download links expire after five minutes and are recipient-bound; watermarks supplement authorization. Evidence cannot be altered, stripped of provenance or represented as a legal opinion. Partners may upload lawful work product under assignment terms but never claim ownership of NOVAR master data.

Misuse: revoke tokens/exports immediately, preserve access and document evidence, scope affected owners/partners, notify Security/Legal, and apply contractual cure/termination as appropriate. Remedies may include injunction, actual damages, repayment of improperly received amounts and indemnity to the extent enforceable; no automatic punitive liquidated damages without counsel approval. Audits are limited to assigned-data use and records; reasonable notice except urgent breach, protect unrelated partner confidential data. Acceptance: executed Appendix K form, eligibility proof, assignment race/cure/reclaim tests, billing schedule, export restrictions and post-termination access/deletion drill.

Section 16A Attorney Network Privilege and Conflict Protocol

16A.1 Client engagement and licensing

Engage an attorney when the approved legal memo requires legal/professional review, authority/entitlement is disputed, a filing/document needs counsel, litigation/appeal arises, an acquisition/title issue needs legal advice, or Legal directs escalation. Platform routing is not engagement. Engagement letter explicitly names client, matter, jurisdiction, scope, fee, payer and whether anyone else receives limited administrative updates.

NOVAR governance advice: client is ENT-OP. Claimant's claim/probate advice: client is the identified claimant/estate representative under counsel's letter. Partner business advice: client is partner. Paying another client's fee does not make NOVAR that client or entitle it to privileged advice; any third-party payment requires counsel-approved informed consent and professional independence. No joint representation without express conflict analysis and engagement terms.

Verify active license, discipline/standing and relevant jurisdiction at entry, annually and before a new matter; monitor changes. Obtain malpractice evidence per 0A; flag expiry. Counsel remains responsible for professional duties and filings. NOVAR staff and AI supply research/document administration, not legal advice, title opinions or determinations of heirs.

16A.2 Conflict privilege and fee controls

Before substantive case material is released, send only minimum conflict metadata via restricted channel: proposed client, adverse/relevant parties, businesses, estates, affiliates, asset/case IDs and matter type. Counsel records conflict check result, date, scope, reviewer and clearance. Recheck when parties, assets, scope or adversity changes and before reassignment. POSSIBLE/FAILED/PENDING blocks substantive access. Written waiver only where professionally permitted, signed by appropriate clients and counsel; system cannot deem a conflict waived.

Privilege is counsel-directed, not created by a label. Records hold privilege_type, client_id, matter_id, counsel_owner, authorized_recipients and legal_basis. Store attorney-client/work-product material in separate matter vault; only counsel/client and counsel-authorized staff have access. General partner portals, executives and platform administrators do not receive privilege merely by role. Do not place privileged material in model prompts, search/vector indexes or general audit payloads. Audit records retain reference/action metadata; content lives in vault. Accidental disclosure triggers immediate restriction, preservation and counsel-directed mitigation; no unreviewed privilege-waiver statement.

Legal fees invoiced and paid separately under counsel-client agreement. Prohibit improper sharing of legal fees with NOVAR/partners, percentages tied to attorney fees, or bundled subscription substitutes that evade professional rules. Administrative integration fees require independent lawful commercial rationale and approval. Counsel directs legal billing/trust handling; Finance sees permitted payment metadata only.

16A.3 Service levels and acceptance

Required coverage: primary and backup counsel for each enabled jurisdiction/matter type, calendars and emergency contact. Critical deadline request acknowledged within four business hours; urgent document review within one business day where accepted coverage permits; routine review within three business days. Counsel must accept the SLA in the service schedule; unaccepted capacity blocks that workflow. Statutory deadlines control; escalate at 50% SLA elapsed and route to backup on breach. No AI autoapproval after a timeout.

Acceptance: executed network and matter engagement forms, named clients, license/insurance proof, conflict clearance/recheck tests, privilege vault negative-access tests, fee separation proof and response coverage schedule.

Section 19B Security Architecture Specification

19B.1 Identity sessions devices and service credentials

Reference design: managed OIDC identity provider selected through vendor review, with SAML federation if required; exact provider/region/admin owners entered in Architecture Decision Record SEC-001 before production. MFA required for every workforce, attorney and partner account. Require phishing-resistant WebAuthn/FIDO2 for privileged and Finance roles; no SMS for privileged access. Owner portal uses secure MFA with accessible recovery that cannot authorize bank changes without separate verification. Passwordless passkeys preferred; if passwords allowed, breached-password checks, no shared credentials and IdP-managed recovery apply.

Access tokens expire in 10 minutes; rotating refresh tokens, reuse detection, maximum session 12 hours; idle 15 minutes for privileged/vault actions and 30 minutes for other sessions. Step-up MFA within five minutes for sensitive export, bank change, payout approval, role grant and rule publication. Logout, suspension and incident revocation invalidate refresh sessions immediately; authorization revision revocation must deny subsequent requests within 60 seconds. Cookies Secure/HttpOnly/SameSite; CSRF protection for cookie-authenticated mutations. Production users only via approved invitation and identity proof; offboarding within one hour of effective termination, immediately for urgent risk.

Managed devices: disk encryption, supported OS, MDM/EDR, screen lock five minutes, patch policy and remote wipe. Privileged staff cannot access from unmanaged devices. Partner/owner unmanaged access is browser-only, restricted views/no sensitive download; step-up device/risk checks. No raw data synced to personal storage. Two hardware-protected break-glass identities, separately held under Security and executive custody, no routine API access; activation alerts immediately, dual approval where possible, time-limited 60 minutes, retrospective review within one business day. Break-glass never overrides legal/source/financial controls.

Workloads use short-lived workload identities and least-privilege service accounts, scoped per service/environment. No human use of service accounts, no wildcard partner access, no embedded keys. Managed secrets store; rotate static vendor credentials every 90 days or stricter contract limit, immediately on exposure. Service tokens expire at most one hour; key rotation supports overlap without indefinite prior-key acceptance.

19B.2 Canonical permission matrix

R = minimum scoped read; W = scoped workflow mutation; A = designated human approval; dash = denied. JIT means time-limited approved access. Short role names in the matrix refer to the full accountable roles defined above. All permissions additionally require tenant, case relationship, jurisdiction, purpose, source rights, sensitivity, current assignment and active approval bundle. No role has universal implicit access.

Role	Discovery pool	Case facts	ID bank tax	Privilege	Assign	Payout	Export
Executive	R strategy	R masked	-	Client only	A	A tier	A scoped
Research	R scoped	R/W drafts	-	-	-	-	-

Role	Discovery pool	Case facts	ID bank tax	Privilege	Assign	Payout	Export
Operations	R relevant	R/W	ID only	By counsel	W/A sep arate	Draft only	Request
Compliance and Privacy	R scope	R/W controls	R JIT	By counsel	A gate	A screen	A rights
Finance preparer	-	R finance	R tokens/tax	-	-	W draft	Reports
Finance approver	-	R proof	R minimum	-	-	A separate	Reports
Partner	-	R/W assigned	Results only	-	Own reports	R own	Denied default
Attorney	Conflicts only	R/W matter	R needed	R/W own	-	Legal review	Matter only
Claimant	-	R own/W input	Own input	Own counsel	-	R own	Own records
Security admin	Metadata	JIT support	-	-	-	-	Incident only
AI and worker	Tool scope	Projection	-	-	Propose only	-	-

Implementation: central policy decision point with default deny and policy revision; policy enforcement at API, workflow transition, DB row filter, object download, search/vector query and event consumer. Row-level policy keys include resource_owner_org_id and access_grant relationship; a partner does not become the owner of shared canonical source facts. Field projection is server-side; denied fields never reach browser/API response. Use transaction-scoped DB tenant context, not client-provided SQL variables. Signed server identity determines tenant; URL tenant IDs cannot override it.

19B.3 Tenant isolation and data boundaries

Shared canonical master data stays in internal service schema. Partners access separately authorized case projections keyed by tenant_id + assignment_id + revision. Primary/foreign keys enforce tenant-compatible links where data is tenant-owned. Search/vector stores use tenant namespaces or mandatory immutable metadata filtering before retrieval and after lookup; broad shared index queries are prohibited for Partner AI. Object storage uses per-tenant/matter namespaces with provider access policy and API proxy/short-lived recipient-bound URLs. Cache keys include tenant, actor, permission version and projection version. Events and exports carry audience/tenant and are reauthorized at consumption/download.

Every release runs cross-tenant negative tests for list/get/update/search/vector, guessed IDs, pagination, exports, signed URL reuse, cache collision, background jobs, webhooks, support impersonation and AI tools. At least two synthetic tenants plus internal withheld opportunity and privileged matter are required. Zero unauthorized rows/fields/events is the passing threshold. Test database constraints and concurrency, not only API happy paths. Quarterly independent isolation review and after every permission/infrastructure change.

19B.4 Encryption secure development and DLP

TLS 1.2 minimum, TLS 1.3 preferred; approved modern ciphers; all internal service connections authenticated/encrypted. At-rest AES-256 using managed KMS envelope encryption. Separate production/nonproduction keys; dedicated restricted-vault keys; key administration separate from content access. Rotate customer-managed encryption keys at least annually; rotate after compromise; preserve decryptability of authorized historical records. Key use, changes and grants logged. Tokenize bank/tax/ID identifiers; graph/search/analytics use tokens or minimized values, not full identifiers. HMAC-based matching tokens use scoped keys, not reversible low-entropy hashes. No full sensitive data in URLs, logs or event payloads.

Protected branches; two-person review for authorization/finance/compliance and at least one independent review otherwise. CI requires unit/integration authorization and state tests, dependency/SBOM/license scan, SAST, secrets and IaC/container scans. DAST in staging before release; independent penetration test before pilot, annually and after material security changes. Critical findings: containment within four hours and fix within 24 hours; high within seven days; medium 30 days; low 90 days. Exploitable critical/high or cross-tenant findings block launch; retest proof required. Infrastructure as code only; emergency changes recorded and reviewed next business day.

DLP: block ID/bank/tax/privileged data in exports, ordinary email and AI prompts; approved reports redact; secure messaging for documents; disable browser clipboard/printing where supported and managed endpoint controls for staff. Browser controls cannot guarantee capture prevention; highly sensitive unmanaged access is denied, visible watermarks and download limits applied. Export thresholds: over 100 cases or 1,000 rows requires Privacy + Security review; partner bulk export prohibited by default. Inspect prompts/uploads/downloads before release, malware scan documents, restrict executable content and archive extraction size.

19B.5 Detection logging and evidence

Central SIEM receives auth/admin/KMS, authorization denials, connector rights changes, exports, bank changes, approval/release, AI tools and network events within five minutes. Alerts: cross-tenant attempts, privilege grants, impossible travel, repeated MFA failures, large export, repeated denied vault access, payment/bank change anomalies, disabled logging and source-right expiry. Log immutable actor/resource/purpose/decision/policy version/correlation/time; content minimization is mandatory. Retention follows 6B. Time synchronized; target drift under two seconds. Forensic copies hashed, chain of custody recorded and incident-scoped retention imposed.

Acceptance: signed identity/key/tenant design decisions; permission matrix tests; key/secret rotation proof; scanning results; independent pen-test closure; DLP probes for all channels; SIEM alert and evidence preservation drill.

Section 19C API Event and Integration Standards

19C.1 API contract

HTTPS JSON REST /api/v1; OpenAPI 3.1 contract in version control. OIDC/OAuth2 audience-bound tokens for people; workload identity/client credentials for services. Required scopes use resource:action, such as case:read, assignment:propose, payment:prepare and payment:approve; scopes never replace ABAC. No API key in URL. Reject unknown fields in writes and invalid enum/UUID/date/money values. Never trust actor/tenant/approval supplied as payload authority.

Cursor pagination with signed opaque cursor bound to tenant, query and permission revision; default 50/max 200; stable order id + created_at; invalid/stale cursor returns 400 without leaking records. Default per-user 60 requests/minute, service 300/minute, sensitive writes 10/minute; connector rate ceilings always follow source rights even if lower. Return 429 + Retry-After; rate limits scope tenant, actor and endpoint. Maintain privacy-safe audit/correlation IDs; structured errors code/message/correlation_id/retryable and no hidden resource disclosure (404 where appropriate).

Mutations support If-Match revision; stale returns 409. Payment, assignment, ingestion and submission writes require Idempotency-Key. Persist canonical request digest and response; same key/different body returns 409. Persist keys at least seven days for routine writes, financial keys through payment record retention; provider IDs never reused. Financial/assignment uniqueness constraints are permanent. No implied exactly-once network delivery; outbox/inbox and idempotent consumers provide exactly-once business effects.

Breaking changes require /v2 and migration, consumer contract tests, six months deprecation notice and 90 days dual support minimum; extend support when consumer migration or legal preservation requires. Publish sunset dates, changelog and owner; emergency security deprecation documented with committee approval and immediate notice. Sandbox uses synthetic data, separate credentials/keys/accounts/queues; no production dumps, payment rails or unauthorized sources.

19C.2 Webhooks and event envelope

Inbound/outbound webhooks use HMAC-SHA256 signature over timestamp + nonce + exact raw body, or approved asymmetric signature; TLS required. Verify known key_id, constant-time compare, timestamp within five minutes and unused nonce/event_id for 24 hours; reject replay/invalid signature before processing. Provider-specific standards may replace this only through Security-reviewed adapter with equivalent controls. IP allowlisting is supplementary. Rotation supports explicit expiring key overlap. Acknowledge only after durable inbox write; retry 1, 5, 15, 60 minutes, max 24 hours then dead-letter; payment source state queried/reconciled if delivery uncertain.

All events validate against JSON Schema 2020-12; additionalProperties=false; schema_semver; IDs UUIDv7; times UTC RFC3339 with explicit null/unknown reason; integer monetary minor units + ISO currency. Common envelope: event_id; event_type; schema_version; occurred_at; producer; resource_id; resource_version; resource_owner_org_id; audience_tenant_ids (restricted routing metadata); actor_id/service_id; correlation_id; causation_id; idempotency_key; policy_version; rights_record_version; payload_hash; payload. Sensitive payloads use secure evidence references. Signed envelope/hash evidences integrity; it does not grant authorization.

Event type	Required payload fields beyond envelope	Validation and consumer effect
ChangeEvent	source_id; connector_id; stable_key; change_kind NEW/CORRECTION/RETRACTION/BACKFILL; old/new version refs; checksum; source_published_at or unknown_reason; detected_at; changed_field_names	Stable key/version uniqueness; no new opportunity for correction by default; ingestion consumes
IngestionRun	run_id; source_version; partition_ids; started/completed_at; fetched/accepted/rejected counts; cursor_before/after; status; reconciliation_id	Counts balance; cursor advances only after durable accepted/quarantined records; graph update projection
Opportunity	opportunity_id; asset_id; from/to_state; strategy; evidence_set_version; legal_rule_version; rights_version; hold_reason	Allowed transition and approved visibility; allocation rechecks current bundle
VerificationState	subject_id; asset_or_case_id; scope; from/to_label; assurance_tier; evidence_ids; contradictions; reviewer; basis; expires_at	Human/professional actor requirements; no AI assignment of LEGAL_DETERMINATION
Assignment	assignment_id; opportunity_id; partner_tenant_id; lock_revision; start/end; milestones; agreement_version; state; approver	One active assignment uniqueness; consumer invalidates revoked grants
Payout	payment_id; entity_id; case_id; payee_token; bank_token; amount_minor; currency; state; screening_ref; approval_ids; provider_ref	No full account; immutable approved amount/destination; Finance system-of-record
AlertEvent	alert_id; resource_id; recipient_ref; channel; template_version; reason; freshness; authorization_decision; dedupe_key	Authorized audience only; dispatch rechecks consent/rights/current lock
SecurityEvent	security_event_id; detector; severity; actor_ref; resource_ref; indicator_refs; action_taken; incident_id	No raw credentials/PII; SIEM incident correlation; forensic hold if needed

Event delivery is at least once. Consumers store processed event IDs with aggregate version; out-of-order older versions do not overwrite newer facts. Per-aggregate ordering and gap detection; gaps trigger source-system re-fetch. Replays require approved scope, rights check and suppression of repeated external alerts/payments. Dead-letter queues have owner, reason, expiry and retry approval. Schema incompatible event is quarantined, not best-effort parsed.

19C.3 Service boundaries and systems of record

Producer to consumer	Contract and prohibition
Connector to ingestion	Raw permitted publication + manifest + rights version/checksum; connector cannot decide claimant entitlement
Ingestion to graph	Validated canonical source facts + lineage + contradictions/change kind; uncertain merges remain separate
Graph to scoring	Rights-filtered evidence projection and graph revision; score writes separate derived object, not source facts
Compliance to all action services	Signed decision with scope, rule/rights/privacy versions, deny reasons and expiry; current reevaluation required
Allocation to partner portal	Assignment-bound minimized projection; internal pool, source secrets and other tenants excluded
Finance to portal	Approved masked payment/economic status; no bank details, tax forms or other payee records
AI gateway to services	Typed proposals only, user/purpose-bound retrieval, tool allowlist; no direct DB or payout execution

Entity or fact	Authoritative system	Copies and reconciliation
Source publication/source factual value	Official source plus permitted immutable NOVAR snapshot	Graph is projection; never overwrite official fact with vendor estimate
Users organizations permissions	Identity/authorization registries	Portal cache expires/revokes; IdP identity distinct from business entitlement
Evidence rights legal rules approvals	Evidence vault + compliance relational store	Search references only; exact version pinned per action
Person/entity relationships and asset facts	Canonical relational facts + reviewed graph projection	Graph/search rebuilt from provenance; merge decisions versioned
Opportunities assignments case workflow	Transactional workflow database	Event bus/portal read models are not approval authority
Actual bank settlement/provider payment	Bank statement and provider authoritative transaction	Finance ledger reconciles; webhook is a notification, not final settled cash
Ledger revenue expense distribution	Posted Finance ledger after reconciliation	Dashboard projections labeled estimated/pending/settled

Entity or fact	Authoritative system	Copies and reconciliation
Tax forms and filing receipts	Restricted Finance tax vault	Ledger references; no partner/AI raw copies
Security incidents and access logs	SIEM + immutable audit archive	Guardian is observer, cannot erase incidents

Integration approval requires named vendor/legal entity, owner, exact scopes, DPA/source rights, sandbox tests, threat model, rate/error limits, secret storage, reconciliation, support/exit/deletion plan and Legal/Privacy/Security approval. Annual vendor review and material-change review. Acceptance: OpenAPI/schemas in registry, consumer-contract suites, replay/out-of-order/idempotency tests, webhook tamper tests, environment segregation and system-of-record reconciliation.

Section 20B Canonical Data Model and Lifecycle States

20B.1 Common schema and invariants

Every object named in Sections 20 and 20A is covered by the catalog below. Grouped records share the common schema but retain their own permanent IDs and typed payload. IDs are immutable UUIDv7 generated server-side; IDs are never recycled. External IDs live in SourceIdentifier {id, object_id, source_id, namespace, external_key, source_version, valid_from, valid_to}; unique (source_id, namespace, external_key, source_version). Do not use names, emails, SSNs or parcel labels as internal IDs.

Common fields required on all domain objects: id; object_type; resource_owner_org_id; jurisdiction_code or GLOBAL; sensitivity PUBLIC/INTERNAL/CONFIDENTIAL/RESTRICTED/PRIVILEGED; purpose_ids; schema_version; revision positive integer; lifecycle_state; created_at/by; updated_at/by; retention_policy_id/version; legal_hold_ids; deleted_at nullable. Source-derived objects also require source_identifier_ids, evidence_ids, rights_record_id/version, source_version, observed_at and lineage. Approval/action objects require applicable legal_rule_id/version and permission_decision_id. Null must carry a reason when a required fact is not known; unknown money is null, never zero. No hard cascade delete of evidence or financial/approval records.

Use append-only ObjectRevision with prior_revision, changed_fields, before/after hashes, actor, reason and event ID. Source fact assertions never overwrite historic snapshots.
Relationship/evidence/permission links are typed foreign keys; owner tenant must match or cross-org access must be explicit. Money uses signed 64-bit integer minor units + ISO currency; confidence decimal 0..1 with method_version; dates/time zones explicit; emails/phones normalized and vault-tokenized where needed; address history includes date validity. Referential integrity and JSON validation run at write and ingestion.

Catalog codes below: R1 discovery/source retention; R2 case/identity retention; R3 legal/rights retention; R4 contract/finance retention; R5 security/operations retention; R6 privacy/AI retention, all resolved by 6B. L1 reference: DRAFT > REVIEW > ACTIVE > SUSPENDED > RETIRED; legal/compliance owner approves ACTIVE. L2 factual: OBSERVED > VALIDATED > DISPUTED > SUPERSEDED or RETRACTED; Research/Operations reviewer validates, disputes remain visible; source corrections never erase history. L3 work: OPEN > IN_PROGRESS > REVIEW > DONE or CANCELLED; accountable case worker, reviewer signs DONE. L4 financial: DRAFT > APPROVED > POSTED > REVERSED; Finance independent approval; posted immutable. L5 immutable log/run: CREATED > RUNNING > SUCCEEDED/FAILED/QUARANTINED > ARCHIVED; service emits, Operations authorizes retry; immutable events are RECORDED > ARCHIVED. Deletion is separate disposition and cannot replace a legal/financial terminal state.

20B.2 Object catalog required typed fields

Each row adds required fields to the common schema. All listed types have independent records; aliases of names are not implicit extra authority. The named owner is accountable for validation; SOR is the service database/vault, not its UI.

Objects	Required typed fields and relationships	Owner SOR lifecycle retention
Organizations Subscribers	exact_legal_name; entity_id; organization_type; status; territory_ids; eligibility_ref; subscriber includes org_id/order_id	Operations; identity/business registry; L1; R4

Additional required implementation objects: SourceIdentifier, ObjectRevision, AccessGrant, ApprovalBundle, ConsentRecord, PrivacyRequest, LegalHold, DeletionBatch, Vendor, Subprocessor, FraudReview, BankAccountVerification, ScreeningResult, PilotCharter, ReleaseApproval, ModelRegistration, PromptVersion, EvaluationRun. Required fields are those specified in their governing sections; common envelope and type-specific validation are mandatory. Owners are respectively canonical data, authorization, Privacy, Legal, vendor governance,

Operations/Finance/Compliance, release committee and AI governance. SOR is the corresponding registry/vault; no duplicate authoritative spreadsheet. Lifecycle uses L1/L3/L5 unless governing section defines a stricter machine; retention uses related case/control category.

20B.3 Transition enforcement contract

Every transition is a command containing object_id, expected_revision, requested_state, reason_code, evidence_ids and idempotency_key. Service resolves actor/role, applicable rules/rights, current holds and approval bundle; commits new revision + audit + outbox atomically. Invalid edge or stale revision returns 409; missing authority returns 403; expired gate returns BLOCKED_CONTROL. Holds are orthogonal flags, not invented progress. Source corrections, appeals and reversals invalidate downstream approval grants without erasing past transitions.

Connector edge	Actor and guard
DRAFT > REVIEW	Technical owner; full source packet
REVIEW > CERTIFIED	Separate Compliance + Security + Operations approvers; all tests PASS
CERTIFIED > LIVE	Release committee; current approval bundle and capacity
LIVE > DEGRADED	Health service or Operations; technical SLO breach; no extra rights
LIVE/DEGRADED > QUARANTINED	Service/Compliance/Security; rights expiry, schema break, auth/security risk; fetch/exports stopped
DEGRADED > LIVE	Operations after recovery and reconciliation; certificate still current
QUARANTINED > REVIEW	Technical owner; fix and renewed rights; must recertify before live
DRAFT/REVIEW/CERTIFIED/LIVE/DEGRADED/QUARANTINED > RETIRED	Operations + Compliance; jobs stopped, retention/deletion and dependents resolved

RETIRED is terminal; replacement uses new connector ID. The requested forward sequence is supported, with recovery edges above defined explicitly; no QUARANTINED > LIVE shortcut.

Opportunity edge	Actor and guard
DISCOVERED > REVIEW > NOVAR_HOLD	Ingestion creates; Research validates; Operations/strategy reviewer applies First Look
NOVAR_HOLD > WATCH or AVAILABLE	Authorized NOVAR reviewer; approved strategy/rights/legal/verification
WATCH > REVIEW	Trigger service; material source change; never direct assignment

Opportunity edge	Actor and guard
AVAILABLE > RESERVED	Allocation service executing Operations approval; eligible partner, conflict/capacity clear, unique lock
RESERVED > ASSIGNED	Operations + partner acceptance; signed terms and current grants
RESERVED > AVAILABLE	Operations; expiration/decline; prior grants revoked
ASSIGNED > ACTIVE	Operations; milestones and coverage met
ASSIGNED/ACTIVE > RECLAIMED	Operations; cure/expiry/breach proof; Legal if disputed; revoke grants atomically
RECLAIMED > REVIEW	Operations; new First Look/conflict review before availability
NOVAR_HOLD/WATCH/AVAILABLE/RESERVED/ASSIGNED/ACTIVE/RECLAIMED > CLOSED	Operations with reason and outstanding duties resolved; Legal/Finance where required

AT_RISK is a risk flag/display label with cure_until; COLLABORATIVE is an approved assignment mode, not a bypass of one-active-assignment constraints. CLOSED does not mean recovered; outcome_code distinguishes recovered, rejected, duplicate, unavailable, cancelled. Closed records reopened only by authorized REVIEW transition with new revision and reason; paid facts remain immutable.

Verification edge	Actor and guard
CANDIDATE > CORROBORATED	Research reviewer; independent consistent attributes; confidence method
CORROBORATED > RECORD_VERIFIED	Operations verifier; authoritative factual record and contradictions addressed
RECORD_VERIFIED > PROFESSIONALLY_VERIFIED	Qualified scoped professional; named reviewer and signed basis
PROFESSIONALLY_VERIFIED > LEGAL_DETERMINATION	Authorized counsel/professional or documented legal process appropriate to matter; exact scope and authority
Any label > earlier label	Operations + Legal where legal/professional conclusion affected; correction or invalid evidence; invalidate action readiness

AI may propose candidate/corroboration evidence, never final professional/legal transition. A court/source determination is recorded as externally evidenced fact by an authorized human. No skipped evidentiary steps; prior professional evidence can satisfy a step only through explicit separate recorded review. UI maps CANDIDATE to CANDIDATE MATCH and preserves the base labels.

Case or claim edge	Actor and guard
INTAKE > DOCUMENT_COLLECTION	Operations; consent/identity scope and approved workflow

Case or claim edge	Actor and guard
DOCUMENT_COLLECTION > LEGAL_REVIEW	Operations; checklist complete; named counsel/conflicts clear when required
LEGAL_REVIEW > SUBMISSION	Human authorized submitter; legal approval or approved no-counsel rule, authority and signed documents
SUBMISSION > PENDING	Operations; official receipt/reference, not merely a sent email
PENDING > APPROVED or DENIED	Operations records official determination with evidence; AI cannot determine entitlement
APPROVED > PAYMENT_REVIEW	Finance/Operations; entitlement evidence and lawful funds flow; V4 prerequisites
PAYMENT_REVIEW > PAID	Finance after verified settlement; direct claimant payment requires official/payment evidence
PAID > CLOSED	Operations + Finance; reconciliation, documents, reporting and residual tasks complete
DENIED > CLOSED	Operations; notice/appeal rights and unresolved duties addressed; no payout
DENIED > LEGAL_REVIEW	Legal/Operations; approved appeal/reconsideration route and new revision
DOCUMENT_COLLECTION/LEGAL_REVIEW/PENDING/PAYMENT_REVIEW > DOCUMENT_COLLECTION	Operations/Legal; deficiency/correction; reset dependent approvals

Administrative cancellation uses CLOSED + CANCELLED outcome with documented approval, no forged APPROVED/PAID progression. Approved direct-holder payout may close without NOVAR payment record, but actual claimant receipt is evidenced separately.

Payment edge	Actor and guard
DRAFT > SCREENED	Compliance/provider validated result; bank/payee verification and lawful classification
SCREENED > APPROVED	Independent human approvers per 18A; exact amount/destination/evidence revision
APPROVED > RELEASED	Authorized independent releaser; fresh screening, cooling-off completed, durable provider request
RELEASED > RECONCILED	Finance; bank/provider/ledger match, confirmed settlement
RECONCILED > CLOSED	Controller; no unresolved difference/dispute
RELEASED/RECONCILED/CLOSED > DISPUTED	Finance; provider/claimant dispute evidence and hold

Payment edge	Actor and guard
RELEASED/RECONCILED/CLOSED/DISPUTED > REVERSED	Finance after confirmed reversal/refund plus reversal journal, not a unilateral status edit
DISPUTED > RECONCILED	Controller; documented resolution and settlement match

Pre-release edits return to DRAFT with all approvals invalidated; cancelled drafts use cancellation flag and archive, no money movement. Failed provider requests stay APPROVED with failure/hold until reconciliation proves whether any release occurred; no blind retry. Acceptance: catalog completeness covering every base object; versioned schema registry; all valid/invalid transition and actor tests; concurrency, correction/appeal and deletion/hold tests; zero unsupported state advancement.

Section 17A Connector Certification and Source Operations Manual

17A.1 Mandatory certification record

No connector becomes LIVE without a versioned certification packet. Required record fields are: certificate_id/version; official agency/source owner; authoritative landing URL and exact endpoint/file/search workflow; dataset name/coverage/exclusions; permission class A-G; Data Rights Record and contract versions; source release weekday/window/IANA time zone; holiday calendar; release anomalies/corrections; ingestion mode; auth method and secret reference; source rate ceiling/burst/concurrency; permitted automation; retry limits; delta mechanism; stable record key; full reconciliation method; completeness formula; schema map and field lineage; validation/quarantine rules; test-fixture hash; technical/Operations/Compliance/source owner; incident contacts; partner sharing/masking/export/attribution/retention; kill-switch test; rollback plan; certification/expiry signatures.

The exact source owner must be distinguished from a portal contractor or reseller. A human-only source cannot be recertified as automated merely because a browser script works. API/bulk/page automation requires express documented permission. CAPTCHA, login restrictions or robots/terms changes cannot be bypassed. Official-source freshness is primary where approved; licensed backup remains labeled secondary. No assumed weekly schedule: enter observed/published schedule and mark unknown when not supplied.

17A.2 Fetch delta and retry procedure

Before each request evaluate LIVE/allowed DEGRADED state, current rights, permitted purpose, geography, auth and rate budget. Send conditional request/cursor if approved; respect 429 Retry-After and source rate ceilings. Default transient retries: five attempts with full jitter at 5, 15, 45, 120 and 300 seconds, adjusted upward to honor limits. Never retry 401/403 continuously; pause and escalate. Breaking schema, rights expiry, prohibited access or unexpected sensitive fields quarantines immediately. Oversized files, malware or inconsistent checksums quarantine the publication.

Persist original permitted manifest/snapshot hash before parse. Stable key plus source version and canonical content hash distinguishes new record from revision. Normalize fields with explicit lineage (input field, transform version, output field). Store rejects with reason in restricted quarantine, not a silently discarded count. Advance cursor only after every fetched item is durably accepted or quarantined and the run manifest commits. Restart from prior durable cursor; idempotency prevents duplicates.

17A.3 Reconciliation and completeness proof

After each publication and at least weekly for supported sources, compare authoritative full manifest, counts, stable IDs and partition checksums with delta result. Complete within 24 hours after publication/availability unless rights/source limitation is certified. Let E be official expected eligible unique records after documented scope filters; A be matching accepted unique records; Q be expected unique records quarantined; M be missing records; X be unexpected records. Require E = A + Q + M; completeness = A/E; accounted coverage = (A+Q)/E; report X separately and compare hashes for matching IDs. E=0 reports N/A plus verified empty manifest, never a fabricated 100% ratio.

Certification pass: completeness 100%, Q=0, M=0, X=0 on test fixtures and production sample or a quantified source limitation approved in scope that prevents a LIVE claim of complete coverage. No case release depends on an unreconciled missing/changed record. If source supplies no verifiable full population, display UNPROVEN_COMPLETENESS and record method/limits; eligible automated production requires committee acceptance of bounded workflow and cannot claim full-source coverage. Partial pagination cannot be treated as full publication.

Tests: duplicate/replayed delivery; cursor restart; daylight-saving and holiday schedules; correction/removal; schema drift; deleted stable IDs; rate limit/auth failure; source outage; partial file; malicious content; permission expiry; forbidden export; kill switch; rollback; full reconciliation. Kill switch must deny new requests and cancel queued work within 60 seconds, while preserving audit and held evidence. Rollback restores approved parser/schema version and reprocesses quarantined data after current rights check; it does not roll back approvals to evade new rules. Acceptance: all mandatory fields populated, signed packet, fixture outputs, measured latency, reconciliation manifest and recorded kill-switch/recovery drill.

Section 13B Correction Retraction and Historical Backfill Rules

13B.1 Classification and identity

Classify source change NEW, CORRECTION, RETRACTION, LATE_ADDITION, AMENDMENT, BACKFILL or RECONCILIATION_DIFFERENCE. Match stable source key before creating objects; publication date alone is not an opportunity identity. Same key with changed amount, identity, ownership, status or availability creates a new source assertion/version linked to existing asset/opportunity, not a second opportunity. A source changes its key: maintain SourceIdentifier alias/crosswalk only after evidence-based review; uncertain identity creates a contradiction and review hold, not auto-merge.

Persist previous/new values, source versions/checksums, effective and observed times, affected field set, rights version and explanation. Source removal is not automatically proof an asset disappeared: confirm completeness of the publication/search scope; mark unavailable/unconfirmed pending source clarification. An explicit retraction supersedes current assertion, retains lawful historical evidence and invalidates reliance. A backfill records historical publication/event date and current detection/processing date; never labels historical data "newly published" unless that is true.

13B.2 Downstream correction procedure

Within five minutes of an ingested material correction, impact service identifies dependent graph edges, verification conclusions, scores, alerts, assignments, cases, documents and payment approvals through lineage. Freeze affected outreach/submission/assignment/payment where identity, entitlement, amount, owner or availability changes. Recompute scores but require human/legal re-verification before restoring transaction readiness. Already released assignments receive a correction notice with minimum facts within one business day, immediately for imminent payment/deadline risk. Revoke outdated export links; request partner correction/deletion of permitted copies and record acknowledgment.

If official filing/payment already occurred, Operations and counsel determine amended filing, agency notification, recall/refund or claimant notification; do not silently mutate signed documents. Finance posts correcting/reversing entries only with evidence. Original alert remains audited and receives a superseding/retraction notice; dispatch dedupe keys include change version to permit one authorized correction alert while blocking replay duplicates.

Backfills run in isolated rate-limited queues, default at most 20% ingestion capacity; current WATCH/release processing has priority. Approve source rights, period, expected volume, schema and cost; reconcile by partition/date and review potential duplicate opportunities. Root-cause codes: SOURCE_CORRECTION; SOURCE_RETRACTION; LATE_SOURCE_PUBLICATION; KEY_REMAP; PARSER_DEFECT; MISSED_DELTA; PARTIAL_FETCH; RIGHTS_SCOPE_CHANGE; DUPLICATE; UNKNOWN. UNKNOWN requires owner and deadline; no statistical "balanced" adjustment to hide differences.

Acceptance: fixtures for every kind; same record revised ten times yields one canonical asset and linked versions; removal from incomplete search does not retract; corrected partner case frozen/notified; historical timestamps truthful; expired rights block replay/backfill; Finance correction preserves original journal.

Section 10A AI Governance Evaluation and Model Risk Controls

10A.1 Approved uses and prohibited authority

Agent or role	Approved proposed output	Enforced limitations
Command and strategy agents	Evidence-linked summaries, prioritization and estimated economics under approved rules	Internal approved views; no release/contract/fee/legal decisions
Guardian and Orchestrator	Monitor metrics; bounded retries/restart on allowlisted technical failures	No changes to source permissions, legal rules, identity determinations, payouts or partner disputes
Identity Estate Heir and Asset specialists	Candidate relationships, factual extraction and research tasks with citations/confidence	No final ownership, title, heirship or entitlement; contradictions remain visible
Compliance/QC/Fraud agents	Apply published rule predicates, flag gaps and anomalies, challenge evidence	No autonomous legal rule publication, denial or clearance of fraud/sanctions
Allocation/Collision agents	Eligible-partner recommendation and conflict alerts	Human assignment/reclaim approval; existing locks and disputes protected
Partner AI	Assigned-case Q&A, reminders and drafts	Isolated tenant/case retrieval; no master pool or sensitive/privileged vault
Owner assistant	Own secure status/document navigation	No legal advice, bank approval or access to other subjects
Report/Valuation/ROI/Competitor agents	Cited reports, estimates and lawful public capability analysis	Approved sources only; estimates labeled; no unauthorized competitor/source access

Prohibited for every model: autonomous legal conclusions; unsupervised outreach; automatic document signing/execution/filing; payout or bank-change approval; rule publication; fee-cap alteration; unauthorized retrieval; source-right circumvention; credential access; user impersonation; privileged-client access without authority; biometric/child profiling; personal-data training without separately approved program. Tool gateway rejects prohibited actions regardless of model instructions.

10A.2 Registry data boundaries and injection protection

Approved model/provider registry: provider legal name; exact model/version; deployment region; permitted agents/use cases; data categories; retention/logging/training terms; DPA; subprocessors; access controls; cost ceiling; context/output limits; evaluation_run; approval; review/expiry; rollback model. No model is approved solely by this document. Production providers must contractually prohibit training on NOVAR inputs and provide accepted retention controls; unverified vendor terms block confidential data use.

Prompt/retrieval/embedding allowlist: minimized lawful nonprivileged case facts and approved evidence excerpts. IDs, full DOB/tax IDs, bank details, tax forms, secrets, attorney-client content and unapproved relationship/sensitive fields are blocked. Embeddings follow source rights and deletion, use tenant namespace and cannot be treated as anonymous merely because vectorized. Fine-tuning on personal data prohibited in pilot. Vendor diagnostic logs must be disabled/minimized under contract; retain redacted traces internally for 30 days.

Treat source text, emails, documents and retrieved pages as untrusted data. Separate system policy from quoted evidence; strip active content; detect instruction injection; never allow retrieved text to grant permissions or override source rights. Server checks every tool against actor, purpose, tenant and resource; no generic shell/network tool for case agents; allowlisted outbound domains; bounded tool count/cost/time; no model access to secrets. Red-team attempts cover injected exfiltration URLs, forged approval instructions, encoded sensitive payloads and cross-tenant retrieval. Human review does not cure unauthorized data sent to a provider.

Structured output schema: run_id; model/prompt/evidence versions; proposed_action enum; assertions [{claim,evidence_ids,source_excerpt_ref,confidence,uncertainty}]; contradictions; missing_fields; risk_flags; suggested_review_role. Validate schema, citations resolve to accessible evidence, claims match cited source and prohibited fields/actions absent. Invalid output is quarantined/retried at most once with redacted validation errors, then human task. Never silently coerce invalid output into a legal status.

10A.3 Evaluation change control and incidents

Pilot frozen evaluation set: at least 200 independently reviewed identity examples including common names, address changes and contradictory estates; at least 100 adversarial tool/access/injection cases; at least 100 citation/extraction examples. Sets use synthetic or lawful deidentified evidence with recorded ground truth and reviewer; no evaluation-data leakage into prompts. Report numerator/denominator and confidence intervals where relevant; benchmark is not a universal field accuracy guarantee.

Evaluation	Release pass condition
Access control tenant isolation and forbidden tools	Zero unauthorized records/fields/tool executions across full negative suite
Final legal status or payout authority	Zero autonomous approvals, executed documents or prohibited conclusions
Source citation/extraction	100% high-risk assertions trace to permitted evidence; at least 98% reviewed factual extraction accuracy; unsupported claim flagged for review

Evaluation	Release pass condition
Identity ranking	At least 98% precision on adjudicated proposed matches; zero automatic irreversible merges; recall reported, no fabricated absence conclusion
Injection/exfiltration	Zero successful data exfiltration or policy bypass; all critical attack fixtures blocked
Sensitive prompt and vendor log leakage	Zero prohibited fields across DLP fixtures and recorded provider settings
Bias/accessibility/fraud impact	Document subgroup/method errors where lawful; any material unexplained adverse pattern blocks affected use pending mitigation

All legal/professional, identity merge, outreach, assignment, contractual and financial proposed actions require designated human approval regardless of confidence. Extraction may populate draft fields only when validation passes; contradictions, missing authoritative evidence, confidence below 0.90 or high-dollar/estate disputes route to independent Operations/QC/Legal. No numerical confidence substitutes for legal process.

Model, prompt, retrieval, policy or tool changes require versioned request, diff, risk assessment, full affected evaluation, Product + Security approval and Legal for regulated outputs. Canary 10% internal traffic for seven days, observe error/override rates; rollback on failed gate. Provider silent model revision triggers reassessment or suspension. Preserve past model/prompt versions and output evidence for auditable cases.

AI incident: stop affected agent/tool/provider, preserve redacted runs and evidence, identify recipients/actions, freeze affected cases, correct/retract harmful output, notify Privacy/Security/Legal, assess bias and unauthorized transfers, run root cause and regression tests before restart. Critical unsafe action/cross-tenant output is SEV1. Acceptance: registry, prompt/data filters, role/tool allowlist, signed test report, human-review queues, change/rollback evidence and incident drill.

Section 12B Service Levels Reliability and Incident Management

12B.1 SLO catalog and measurement

Rolling calendar-month measurement; operational latency percentiles include failed/late eligible events as misses. Report successful denominator, exclusions and incident IDs. Unknown official publication time cannot support an actual publication-to-detection claim; report detection-to-processing separately and source timestamp availability. Exceptions never silently remove the failure from the report.

Indicator	Pilot target and measurement	Owner and escalation
Application availability	99.9% monthly successful eligible requests; valid auth/4xx user errors excluded, system/auth-provider failures included	Engineering; 0.1% error budget (~43.2 min in 30-day month)
Connector availability	P1/P2 99.5%; P3/P4 99.0% eligible scheduled checks successful; source outage separately reported	Operations; per-source budgets 0.5%/1%
Detected publication to ingestion	At least 95% processed within 15 min of detection, as base 23A; end-to-end publication to processing also 95% within 15 min where publication time/rights support it	Operations/Engineering; 5% latency budget; preserve distinct clocks
Publication to detection	Supported P1/P2 p95 <=5 min; P3/P4 p95 <=10 min within approved publication monitoring window	Connector owner; unsupported timing requires explicit scope exception
Detection to processing	p95 <=5 min; p99 <=15 min; priority WATCH p95 <=2 min	Engineering; ingestion backlog alert
Processing to authorized alert	p95 <=2 min; p99 <=5 min; delivery receipts tracked independently	Operations; dispatch attempt/delivery distinguished
Queue lag	p95 <=60 sec; no priority item >5 min unacknowledged	Engineering; page at 5 min sustained for 5 min
Reconciliation completion	100% supported publications reconciled within 24 hours; zero unexplained missing records before related release	Operations; hold impacted records
Processing error and duplicates	<1% failed eligible records/month; zero duplicate business effects on replay tests and payouts/assignments	Engineering; duplicate financial/tenant effects SEV1
Source schema/staleness	Zero unreviewed breaking changes promoted; stale threshold each source = approved window end + 30 min default, or certified source limit	Operations/Compliance; UNKNOWN timing displayed honestly
Security response	SEV1 acknowledge 15 min/initial containment 60 min; SEV2 acknowledge 1 hour/containment 4 hours	Security incident commander; 24/7 rota required
Partner/claimant support	Urgent payment/access/deadline issue acknowledge 1 business hour; routine 1 business day; privacy statutory deadlines separate	Operations; support hours 8am-6pm America/Chicago weekdays, urgent security on-call 24/7

Indicator	Pilot target and measurement	Owner and escalation
Backup and restore	Encrypted daily backup + continuous DB PITR; RPO <=15 min, RTO <=4 hours; quarterly restore drill	Engineering; case/Finance reconciliation after restore

For 95% target, error budget is 5% of eligible publications; for latency percentile targets count all eligible missing completions as violations after deadline. Exception codes: SOURCE_OUTAGE, SOURCE_NO_TIMESTAMP, SOURCE_RATE_LIMIT, HUMAN_ONLY, RIGHTS_HOLD, SCHEMA_QUARANTINE, HOLIDAY_VARIANCE, PROVIDER_OUTAGE. Record source/workflow, duration, impact, owner, mitigation and approval; product reports actual freshness, not an "instant" badge for human-only or stale feeds. Technical outage and lawful restriction are distinguished, neither authorizes bypass.

50% monthly budget burned triggers owner investigation and daily report; 100% burn freezes nonessential releases for affected service until recovery plan approved. Fast-burn page when projected monthly burn exceeds 10% in one hour or >25% in six hours. No budget allowance for legal/source violations, cross-tenant leaks or uncontrolled payments. Monthly report includes SLOs, denominators, exception totals, incidents, source gaps, support aging, cost and remediation owner/date.

12B.2 Incident command and recovery

SEV1: unauthorized tenant/sensitive disclosure, active compromise, payment fraud/control failure or material unlawful activity. SEV2: material source/system outage, schema failures, looming critical deadline or degraded essential controls. SEV3: bounded defect without sensitive exposure. Assign incident commander, Security/Privacy/Legal/Operations/Finance leads as affected and executive contact. On-call roster and tested contact methods are release gates; empty contact fields block production.

Order: acknowledge/declare severity; stop affected activity using scoped kill switch; preserve logs/evidence and ledger; contain credentials/data/payment paths; assess affected people/tenants/source rights; counsel sets notification duties/deadlines by jurisdiction; send approved factual updates; recover known-safe version; reconcile records/payments; revalidate grants, holds and deletion tombstones; obtain restart approvals; conduct blameless root-cause review within five business days. Do not delete forensic evidence or conceal unknown impact. Restore test includes tenant policy and Finance/idempotency invariants, not just application boot.

Acceptance: complete rota/runbooks, production metrics and dashboards, 30-day pilot observations or prelaunch soak baseline, alert routing drills, backup restore/DR proof, incident tabletop and monthly report template.

Section 22B Pilot Charter and Release Governance

22B.1 Texas charter TX-UP-001

Proposed pilot only; approval status BLOCKED until evidence fields are completed. Asset: Texas state-held unclaimed cash property recorded by Comptroller. Workflow: approved official discovery > factual matching > human-reviewed contact or claimant-initiated intake > identity/authority verification > lawful assistance agreement if applicable > prepared claim packet > human/claimant-approved official submission > agency determination > direct agency payment to claimant > independently verified receipt > separate lawful service invoice if contracted > reconciliation and closure. Excludes estates, minors, disputed entitlement, real estate, minerals, securities liquidation, court/bankruptcy funds, acquisitions and NOVAR custody. Complex cases stop and route to later workflow approval rather than quietly enlarging this pilot.

Official source owner: Texas Comptroller of Public Accounts. Authoritative program landing URL: https://comptroller.texas.gov/programs/unclaimed/ ; claimant search portal: https://www.claimittexas.gov/ . These identify the agency and public workflow, not proof of licensed automated access. Exact approved API/bulk endpoint, dataset/schema, source agreement, Data Rights Record and certificate are mandatory charter fields and currently UNAPPROVED. Until granted, no automated production connector; a human-only approved research route may be separately piloted and cannot count as DIRECT-STATE LIVE or satisfy automated timing gates. No presumed public API or weekly release schedule.

Charter field	Default boundary or evidence required
Duration and population	60 days after signed release; up to 25 consenting adult natural-person claimants; one state; one cash-claim workflow
Case and dollar exposure	<=25 active cases; individual face value <=$10,000; aggregate current face value <=$100,000; unknown value blocked; no NOVAR principal custody; operating-payment batch <=$5,000
Roles	Named internal Research, Operations, Privacy/Compliance, Security, Engineering, Finance preparer/independent approver; primary/backup Texas counsel; no external partner seats in initial pilot
Communications	Secure portal; claimant-initiated email; counsel-approved postal notice if authorized; human review every outreach; SMS/automated calls off
Legal and rights versions	Texas exact workflow memo, counsel-approved fee/form/outreach analysis, registrations/broker analysis, rules/rights/retention versions; fill immutable IDs
Staffing and support	Named daily Operations owner, verification reviewer, 24/7 Security on-call, Finance dual control and accepted attorney SLAs

Charter field	Default boundary or evidence required
Commercial form	No-fee test unless approved service agreement/economics signed; no 60/40 of owner gross funds; later partner expansion requires new charter
Technology	Certified source connector or explicitly approved human-only exception; managed identity/vendor/model registry; permission and transition package version
Rollback	Disable outreach/assignment/submission/payment initiation; quarantine source; revoke grants; preserve case/claimant status; handoff pending matters to Operations/counsel
Kill-switch owners	Named Security incident commander, Compliance lead and Operations backup; any may stop affected workflow; committee required for restart

Cap enforcement is transactional at case admission and payment approval; aggregate value increases freeze admissions/affected actions. An external partner pilot must amend population, contract/economics, coverage and data-sharing approval; the 100-seat national target is not authority to activate seats here.

22B.2 Test scenarios pass metrics and go no go

Required scenarios: normal claim; same-name false match; historic address; invalid/expired ID; authority mismatch; bank name mismatch/change; sanctions near-match; duplicate/replay; revised/retracted source; schema/rate/outage; rights/rule expiry; tenant guessed ID; prompt injection; privacy deletion/hold; missed milestone; disputed invoice; provider event out of order; payment reversal; backup restore; kill switch; denied claim and appeal. Synthetic partner tenants test isolation even though no external partners enter pilot.

Pass: 100% mandatory control scenarios succeed and prohibited actions denied; no unresolved critical/high security finding; zero unauthorized export/tenant leak; 100% test ledger balanced/reconciled; no duplicate opportunities/assignments/payments under replay; exact source counts reconcile; at least 95% eligible supported detected publications processed within 15 min; 100% pilot claims have complete checklists/approvals; independent review of every match; adjudicated match precision >=98% over evaluation set; every real pilot false match is held before outreach/submission. Record small-sample limits; 25 cases do not prove national quality. 100% pilot staffing passes training; incident tabletop and restore drill pass.

Go/no-go committee: Executive sponsor, Legal lead, Compliance/Privacy, Security, Engineering, Product, Operations and Finance controller. Every domain signs its evidence; no majority vote may override unresolved legal/source/privacy/financial/security mandatory gates. Decision includes charter hash, software build SHA, migrations, model/prompt/schema/policy versions, test runs, approved sources, rollout time and rollback owners. Release by Engineering through approved deployment after committee approval. First seven days internal canary; external claimant admission in batches of five with daily review.

Stop conditions: rights/terms revoked; unapproved source automation; expired license/insurance/counsel coverage; security or tenant incident; uncontrolled payout/bank change; unresolved legal question; false match reaching outreach/submission; incorrect legal determination;

material correction ignored; unbalanced settlement; exceeded case/value caps; any mandatory gate expires. Scoped service stops immediately, not at next committee meeting. Restart requires root-cause evidence, affected-case remedy, regression pass and fresh domain approvals. Pilot exit after 60 days requires signed outcome report, performance/false-match/complaint/Finance metrics and renewed charter before any state, asset or population expansion.

Acceptance: completed charter with exact IDs and named people, all gates PASS, signed release record, cap/kill-switch proof, tested rollback and full case closeout sample. Planning defaults are not release approval.

Appendix A Legal Memorandum Template

Form LM-01 | Required per jurisdiction asset type and workflow | Owner Legal

Complete: memo_id/version [ ]; jurisdiction/state/county/court [ ]; asset type [ ]; workflow/actions [ ]; operating entity/exact role [ ]; parties/client [ ]; facts/assumptions [ ]; issue statements [ ]; effective date [ ]; next review/expiry [ ]; counsel/name/license/jurisdiction [ ]. For each authority record official URL, section, effective/amendment date, retrieved date, text hash, interpretation, exceptions and applicability. Identify missing or conflicting authority; unresolved issue = BLOCKED.

Analysis fields: entity qualification; locator/recovery/debt/brokerage/referral/title/escrow/money-transmission triggers; data-broker/privacy rules; source use; permissible contact channels/timing; waiting periods; claim eligibility/authority; signature/notary/filing conditions; compensation type/basis/cap; attorney fee independence; funds flow; tax; retention/consumer rights; prohibited practices. Separate confirmed law from counsel judgment and NOVAR stricter policy.

Decision: allowed_actions [ ]; prohibited_actions [ ]; required licenses/insurance/contracts [ ]; required disclosures [ ]; compensation model/version [ ]; outreach template/version [ ]; verification requirements [ ]; rule predicates/test cases [ ]; approval limits [ ]; kill-switch scope [ ]. Record risk GREEN/YELLOW/RED and rationale; yellow items need explicit conditional constraints, not implied clearance.

Signatures: preparing counsel [date]; reviewing counsel/legal lead [date]; Compliance rule-extraction approver [date]; Product/Engineering implementation acknowledgment [date]. Acceptance attachments: current authority, approved contract, tested rule bundle, registration/insurance, evidence IDs. Re-review on law/source/business/funds-flow change or by review date. Status DRAFT/REVIEW/APPROVED/SUPERSEDED/REVOKED; publication separate from approval.

Appendix B Data Rights Record Template

Form DRR-01 | Owner Compliance | No automated access while incomplete

Header: record_id/version [ ]; source legal owner [ ]; official URL/exact dataset/endpoints [ ]; contract/terms URL/version/hash [ ]; permission A-G [ ]; licensee entity [ ]; effective/renewal/expiry dates [ ]; owner/reviewer/contact [ ].

Permissions grid to complete for each action: retrieval method/manual/API/bulk/page [ ]; automation scope/rate/concurrency [ ]; authentication [ ]; commercial use [ ]; internal research [ ]; derived scoring/graph [ ]; partner/counsel/claimant sharing [ ]; resale/redistribution [ ]; exports [ ]; AI inference/embedding/training [ ]; geographic/remote-access scope [ ]; sensitive-field restrictions/masking [ ]; attribution/notice [ ]; retention min/max and clock [ ]; deletion/correction duties [ ]; audit evidence [ ]; renewal/termination [ ]. Use ALLOWED/CONDITIONAL/PROHIBITED with exact condition; unknown is PROHIBITED until approved.

Enforcement: connector policy ID [ ]; role/field projections [ ]; rate limiter [ ]; expiry/kill switch [ ]; retention resolver [ ]; export attribution [ ]; downstream revocation [ ]; test fixtures/results [ ]. Conflict with required case retention or law [ ]; counsel resolution [ ]. Approvals: source permission evidence, Legal, Privacy, Security as applicable and Compliance. Recheck before every fetch/share and material source terms change.

Appendix C Connector Certification Packet

Form CON-01 | Owners Technical Operations Compliance

Packet cover: connector_id/version [ ]; source_id/official owner/authoritative URL [ ]; exact dataset/workflow [ ]; source class/DRR/license versions [ ]; modes and permitted methods [ ]; schedule weekday/window/timezone/holiday/anomalies [ ]; current official source publication timestamp method [ ]; unknown-time treatment [ ].

Technical sheet: credentials vault ref [ ]; auth scopes [ ]; rate/burst/concurrency/retry limits [ ]; cursor/ETag/Last-Modified/checksum/version/diff [ ]; stable key [ ]; key change mapping [ ]; schema map per field/input/transform/output/sensitivity/rights [ ]; file size/type/malware limits [ ]; partition/full-manifest reconciliation [ ]; E/A/Q/M/X counts/completeness [ ]; fixture hash [ ]; raw retention [ ]; downstream projections/attribution [ ]; source correction/retraction rules [ ].

Evidence sheet: contract/rights expiry enforcement; replay/cursor restart; rate/auth outage; source window/timezone; correction/backfill/removal; schema quarantine; complete manifest; tenant/export protection; measured clocks; dead-letter handling; kill switch within 60 seconds; rollback and recovery. For each test give input/output hash, expected/actual, result, build SHA, reviewer and time. Missing authoritative full record universe must be disclosed as UNPROVEN_COMPLETENESS.

Contact sheet: agency/source owner [ ]; technical owner [ ]; Operations [ ]; Compliance [ ]; Security [ ]; 24/7 escalation [ ]; retry/dead-letter owner [ ]. Certification signatures and expiry [ ]; production activation committee ID [ ]. CERTIFIED does not equal LIVE; launch requires current charter.

Appendix D Privacy Impact Assessment Template

Form PIA-01 | Owner Privacy

Identify feature/workflow/entity [ ]; jurisdiction/subjects incl. minors or estates [ ]; inventory version [ ]; data categories and direct/generated/inferred fields [ ]; sources/rights [ ]; purposes and legal conditions [ ]; volume/scale [ ]; notice/consent/version [ ]; recipients/processors/subprocessors [ ]; U.S./foreign storage/support locations [ ]; sale/sharing and broker determination [ ]; automated/profiling functions [ ].

Trace data flow from collection to vault/graph/search/vector/AI/partner/Finance/deletion. For each step record minimum necessary fields, encryption/tokenization, actor/access policy, vendor logging, retention clock, rights retrieval/correction/deletion and hold conflicts. Evaluate identity error, inference exposure, unwanted outreach, discrimination, child/estate sensitivity, reidentification, cross-tenant access and unauthorized model reuse.

Risk record: threat/impact/likelihood [ ]; existing control [ ]; mitigation/owner/due [ ]; residual risk [ ]; decision APPROVE/CONDITIONAL/BLOCK [ ]; required legal/privacy assessment [ ]; vendor DPA/deletion proof [ ]. Rights request/opt-out/appeal dry run and sensitive-data DLP result required. Privacy + Legal approval; Security acknowledges technical controls. Reassess new purpose, source, jurisdiction, sensitive category, model, partner disclosure or foreign access.

Appendix E Security Threat Model Template

Form SEC-TM-01 | Owner Security Engineering

Scope/diagram/version/build [ ]; assets and data classification [ ]; actors including hostile partner/source/model [ ]; trust boundaries [ ]; endpoints/tools/vault/keys [ ]; system-of-record mapping [ ]; threat assumptions [ ]; vendor dependencies [ ].

For each attack record ID [ ]; entry point [ ]; preconditions [ ]; attack path [ ]; targeted tenant/record/field [ ]; confidentiality/integrity/availability impact [ ]; current controls [ ]; test fixture [ ]; result/evidence [ ]; residual severity [ ]; remediation owner/date [ ]. Mandatory threats: guessed IDs and cache leak; search/vector leakage; signed-link reuse; malicious webhook/replay; source schema/terms change; prompt injection/tool exfiltration; secrets theft; bank-change impersonation; approval race; export/DLP bypass; backup/deletion resurrection; privileged-matter disclosure; service-account escalation.

Signoff Security + Engineering, Privacy for personal-data flows, Finance for monetary threats. No critical/high unresolved launch issue; legal/tenant/payment guard exceptions disallowed. Independent pen-test report, remediation retest and incident kill-switch drill linked. Revisit architecture/role/provider changes.

Appendix F Verification and Fraud Checklist

Form VF-01 | Owner Operations with Finance Legal Compliance

Case/asset/claimant IDs [ ]; jurisdiction/workflow [ ]; official asset/evidence version [ ]; face value/unknown flag [ ]; target tier V0-V4 [ ]; fact label and scope [ ]; checker independent reviewer [ ]; checklist date/expiry [ ]. Record PASS/FAIL/BLOCKED/NOT_APPLICABLE (N/A with signed reason) for each line.

Identity: approved method/vendor transaction [ ]; ID validity/authenticity [ ]; historic address evidence [ ]; name/DOB/identifier mismatch [ ]; contradictory claimant [ ]; document integrity [ ]; verified contact [ ]. Authority: own entitlement/source basis [ ]; entity standing/signer [ ]; estate appointment/letters/order [ ]; source-specific required documents [ ]; professional/legal scope and signed review [ ].

Fraud: high-dollar/unknown/complex case escalation [ ]; abnormal urgency [ ]; duplicate claimant/device/doc [ ]; risk score/method and human interpretation [ ]; sanctions/list version/freshness/result/clearance [ ]; bank owner/title proof [ ]; bank change/out-of-band callback [ ]; 72-hour cooling-off [ ]; payee match [ ]; third-party destination check [ ]. Payment: lawful component/economics [ ]; entitlement determination [ ]; no custody/commingling [ ]; two approvals bound to amount/bank/revision [ ]; provider/bank settlement proof [ ].

Decision: permitted next action [ ]; missing evidence [ ]; hold ID/reason [ ]; appeal route [ ]; reviewers/date [ ]; privacy retention/deletion schedule [ ]. Verification fact status never alone authorizes payout. Any failed required line blocks the relevant action; closure includes reviewer attestations, not AI certification.

Appendix G Compensation Approval Worksheet

Form COMP-01 | Owners Finance Legal

Transaction/case/entity/parties [ ]; jurisdiction/asset/workflow [ ]; NOVAR/partner/counsel roles [ ]; classification RECOVERY/ACQUISITION/JV/REFERRAL/SUBSCRIPTION/DATA/LEGAL/OTHER [ ]; legal memo/rule/version/effective/expiry [ ]; licenses [ ]; agreement/version [ ]. Mixed components require separate rows and routes; no blended cap circumvention.

For each component: payer/payee [ ]; legally permitted basis [ ]; gross asset fact [ ]; recoverable fee basis [ ]; maximum percent/dollar cap [ ]; proposed percent/amount [ ]; permitted split [ ]; allowable costs/taxes [ ]; attorney fee excluded [ ]; claimant net disclosure [ ]; required waiting period/cancellation/disclosure [ ]; payment trigger [ ]; account/entity/custodian [ ]; refunds/clawbacks [ ]; supporting authority [ ]. Prove cap arithmetic and prohibit fee relabeling.

Illustrative arithmetic only: if counsel confirms Texas Section 74.507 applies to a $10,000 cash recovery, NOVAR assistance fee may not exceed the applicable 10% ceiling ($1,000), with attorney fees treated separately under the law and engagement. A 60/40 approved commercial split, if independently lawful, would split the lawful business fee, not the $10,000 claimant asset. Example is not an approved transaction or attorney fee-sharing permission. [R1]

Approvals: Legal classification/caps [ ]; Finance arithmetic/route [ ]; claimant/partner disclosures and signatures [ ]; independent payment approval separate [ ]. Output APPROVED/BLOCKED with exact permitted components and expiry; calculations must fail closed without approval.

Appendix H Partner Assignment Packet

Form ASG-01 | Owner Operations

Assignment/opportunity/asset IDs [ ]; partner entity/tenant/user [ ]; state/asset eligibility [ ]; executed MSA/order [ ]; licenses/insurance/training dates [ ]; screening [ ]; preexisting interest/conflict result [ ]; capacity and deadlines [ ]; rights/field projection/export limits [ ]; legal memo and compensation version [ ].

Lock schedule: RESERVED start/end [ ]; ASSIGNED start/end [ ]; ACTIVE extension approval [ ]; one-active constraint result [ ]; milestones/owners/due/evidence [ ]; weekly reporting [ ]; cure and AT_RISK deadline [ ]; reclaim criteria [ ]; dispute route [ ]; handoff owner [ ]. Economic schedule: legal component/basis/split/caps/cost preapproval/tax/trigger/refund/clawback [ ]; no-guarantee acknowledgment [ ]; claimant disclosures [ ].

Attachments: approved evidence packet/watermark/export IDs; engagement/conflict clearance; outreach templates/consent; tasks and deadline calendar; signature and approval. Partner accepts permitted scope and lock terms; NOVAR approver is independent of conflicted beneficiary. At reclaim revoke grants, stop outbound messages, preserve evidence, protect deadlines and record disposition of permitted accrued fees; new packet required for reassignment.

Appendix I Incident Runbook Set

Form IR-SET-01 | Owner incident commander | Named contact roster required

Every runbook begins with incident_id, discovered_at, reporter, severity, affected entity/source/tenant/case/payment, commander, evidence/hold reference and notification deadline record. SEV1 acknowledge 15 min/contain initial risk within 60 min; legal reporting deadlines are separately determined. The following runbooks supply distinct stop and restart controls.

Runbook	Immediate containment and evidence	Recovery approval and proof
Security breach	Revoke implicated sessions/keys, isolate host/service, preserve identity/network/KMS/SIEM logs and forensic hashes; Security + Privacy + Legal assess impact/notice	Security/Legal authorize clean build, credentials rotated, exposure scoped, regression/pen retest and notifications addressed
Unauthorized disclosure	Disable recipient grants/download links, stop exports/outreach, preserve export_id/watermark/fields/audience, request lawful recipient deletion; notify Privacy/Legal	Confirm recipient remediation or documented residual risk, corrected rights projections and authorized notification; Privacy/Security signoff
Payment fraud	Freeze pending releases and account changes; contact bank/provider fraud channel immediately; preserve callback/approval/provider/ledger evidence	Finance/Compliance/Legal authorize; recall/reversal facts reconciled, new bank verification/cooling-off, control test; no blind reissue
Source outage	Mark DEGRADED/stale; stop unsupported freshness claims; bounded rights-compliant retry; secondary clearly labeled; protect WATCH deadlines	Operations recovers official source, replays delta idempotently, reconciles full release; source-truth clocks displayed
Source rights expiration	Auto-QUARANTINE connector and dependent sharing/exports; stop queued fetch, preserve only lawfully retainable evidence, notify source owner/Compliance	Executed renewed rights + current legal/retention review; recertification and deletion/rights tests before live
Schema break	Quarantine publication; cursor held; preserve permitted raw/hash/schema diff; identify affected parsed fields/cases	Approved map/parser, fixture and reconciliation pass, corrections propagated, Operations/Compliance recertify
Partner access violation	Suspend account, revoke tokens/assignment projections and exports; preserve cross-tenant/AI/access traces; protect claimant deadlines	Security/Legal enforce contract, recheck identity/training/isolation; no automatic reinstatement; remedy affected cases

Runbook	Immediate containment and evidence	Recovery approval and proof
Legal rule revocation	Freeze affected outreach/contracts/submissions/assignments/payments by rule/workflow; preserve historic approvals and list affected cases	Qualified counsel approves replacement memo/rule, tests pass, affected cases remedied, committee authorizes scope restart

For all incidents send counsel-approved minimum factual status updates; do not speculate about entitlement or breach size. During recovery reapply holds, deletion tombstones, tenant policies and Finance reconciliation. Root-cause report within five business days: timeline, failure class, impact, missing controls, remediation owner/deadline, test and recurrence prevention. Quarterly tabletop rotates all eight scenarios; at least one real kill-switch and restore drill each quarter. Keep notification law matrix current and test contact roster monthly.

Appendix J State Workflow Launch Checklist

Form LAUNCH-01 | Owner release committee | FAIL or unknown blocks release

Gate	Required evidence and pass rule	Signer
Legal baseline	Exact jurisdiction/asset/workflow memo current; rule predicates/version tested; prohibited actions blocked	Legal + Compliance
Entity licensing authority	Entity map/standing; registrations/license or reasoned nonrequirement; signer authority; insurance bound/current	Legal + Finance
Economics and contracts	Approved compensation model/caps; executed forms/orders; legal fee separation and disclosures	Legal + Finance
Sources and freshness	Official source/DRR current; certification complete; schedule/delta/reconciliation/kill switch and timing proof	Compliance + Operations
Privacy records rights	Inventory/PIA/notices/consent/broker review/DPA; rights/appeal; retention/hold/deletion/restore tests	Privacy + Legal
Security and isolation	Permissions/tenant/field negative tests; pen-test closure; managed identity/keys/EDR; DLP/SIEM	Security + Engineering
Verification fraud money	Tier and mismatch tests; sanctions/account change/dual control; funds-flow/provider reconciliation/tax owner	Operations + Finance + Compliance
Counsel and partner	Coverage/license/conflict/privilege/fees; partner eligibility/assignment/export/cure/reclaim tests if enabled	Legal + Operations
AI	Model/prompt registry, input filters/tool limits and evaluation all pass; human review and rollback	Product + Security
Audit model state	Every base object schema/owner/history; invalid transitions blocked; decision trail and exports verified	Engineering + Product
Reliability incidents	Metrics/error budgets; support/on-call; eight runbooks; DR/incident drill and monthly report	Operations + Security + Engineering
Pilot and release	Charter caps/population/channels/training; scenarios pass; signed go/no-go/build/rollback evidence	All committee domains

Base Definition-of-Done Sections 23 and 23A remain included: security classification, professional coverage, verification status, partner visibility/collision, audit, monitoring and product/legal signoff. Checklist record lists each evidence hash, test run, approval/expiry, unresolved issues, gate result and deploy ID. A general "approved" checkbox cannot replace individual controls. New state, asset, source, partner population or funds-flow pattern requires new scoped release; national marketing does not grant nationwide operating clearance.

Appendix K Contract Forms and Execution Controls

These are substantive draft forms for counsel adaptation and execution, not executed agreements or a representation of universal enforceability. Complete exact parties, schedules, law/venue, liability allocation, statutory disclosures and signatures before use. Templates become binding only when properly approved and executed. Required legal obligations and owner rights cannot be overridden by contract. Document registry stores template hash/version, jurisdiction approvals, authorized signer and executed copy.

K.1 Partner master agreement and assignment schedule

Parties: [verified ENT-OP exact name/address] (NOVAR) and [partner legal name/entity/address] (Partner). Effective date [ ]. Governing law/venue [counsel-approved]. Order schedule: territory/asset scope [ ]; seat [ ]; subscription price/taxes [ ]; billing/term [ ]; notice addresses [ ]. Assignment schedules identify protected opportunity IDs, permitted data, scope, lock dates, milestones, lawful economics and preexisting interests.

Clause 1 Services and no guarantee. NOVAR provides access only to authorized case projections and research/workflow tools specified in the Order. NOVAR retains its platform IP and permitted proprietary research; source data remains subject to its owner's rights. The Partner receives a limited, revocable, nontransferable license during the authorized term and assignment. There is no guarantee of opportunity volume, recovery, title, entitlement, asset value, return or exclusivity beyond the signed assignment. Neither party may represent NOVAR as a government agency or law firm.

Clause 2 Eligibility and use. Partner shall maintain required standing, licenses, insurance, trained users, truthful capacity/conflict disclosures and approved contact methods. Partner shall use assigned information only to perform the specified lawful workflow, maintain confidentiality and follow written data restrictions. Partner shall not resell, redistribute, train models on, mass-export or use information for unrelated solicitation, nor share accounts, access another tenant or contact owners outside approved channels. Partner shall promptly disclose preexisting relationships before accepting an assignment; documented preexisting work is excluded from non-circumvention to the extent listed in the schedule.

Clause 3 Protected opportunities and assignments. During the stated lock and [counsel-approved duration, default proposal 12 months] after receipt of an identified protected introduction, Partner shall not knowingly bypass NOVAR to exploit that specifically identified opportunity in breach of the schedule. The restriction does not cover public market activity unconnected to NOVAR information, listed preexisting relationships, owner choice of counsel or protected lawful activity. Any non-solicitation covenant requires separate approved addendum; absent that addendum none is implied. Assignment defaults and cure rules are Section 9A and must be attached, not silently changed. Partner shall acknowledge, report milestones and transfer case evidence on reclaim/termination. Disputed reclaims route to [independent review/escalation], with ongoing owner deadlines protected.

Clause 4 Fees costs and taxes. Subscription is [price] payable [date/rail], independent of regulated outcome fees. Transaction fee/split exists only in a signed legally approved component schedule, subject to governing caps and disclosures; attorney fees and owner entitlements are excluded. Costs above [amount] need prior written approval and any required owner consent. Each party bears its own taxes except express withholding/remittance duties. Clawback applies only to

[fraud/error/reversal/material breach grounds], to the amount actually owed after notice and dispute review; it does not authorize unilateral seizure of owner proceeds. Refund and cancellation rights: [approved order/statutory terms].

Clause 5 Suspension and enforcement. NOVAR may immediately restrict access for security, source-right, sanctions or unlawful-use risk; ordinary delinquency and performance breaches follow the attached notice/cure calendar. Suspension does not excuse necessary claimant/counsel handoff. Partner shall preserve relevant evidence, cooperate with proportionate investigation and limited compliance audits and notify NOVAR within 24 hours of discovery of suspected disclosure or misuse. Audit access is confined to assigned-data handling and protects unrelated confidential material. Remedies are lawful equitable relief, actual damages and approved indemnity; no automatic punitive assessment.

Clause 6 Termination and survival. Either party may terminate under [term/notice]; material breach not cured under schedule permits termination, immediate where required by law or safety. Within two business days Partner delivers complete authorized case handoff; within ten days returns/deletes permitted copies and certifies disposition, except specific lawful holds disclosed to NOVAR. Confidentiality, source restrictions, accrued lawful payment duties, dispute and evidence duties survive as applicable. Revoked online access does not establish deletion of offline copies.

Clause 7 Liability disputes and general terms. Liability cap [negotiated amount] and exclusions [fraud/willful misconduct, data misuse, confidentiality, unpaid amounts as counsel approves]; mutual/specific indemnity [scope and defense procedure]; mandatory nonwaivable rights preserved. Dispute route: written notice, good-faith executive review within ten business days, then [approved mediation/court/arbitration], with urgent injunctions where lawful. Amendments signed by authorized parties; assignment/subcontracting requires written consent; no agency, legal partnership or power to bind owners. Signatures and title/date [NOVAR]; [Partner]. Attach signed Order, Assignment, data-use/DPA schedules and insurance/training evidence.

K.2 Attorney network services and matter engagement form

Network parties: [ENT-OP] and [law firm]. Coverage schedule [jurisdictions/matter types/primary and backup lawyers], accepted SLAs [ ], insurance/license evidence [ ], network administrative fee [lawfully approved fixed services if any, not legal-fee sharing], term/notice [ ]. This network agreement does not itself engage the firm for any claimant or create a joint client relationship.

Clause 1 Professional responsibility. Firm independently determines professional judgment, conflicts, scope, legal advice, client authority and required filings. Firm shall maintain licenses and malpractice coverage, notify NOVAR of relevant limitations/expiry and decline work beyond accepted capacity. NOVAR supplies lawful research and administration; it shall not direct a legal conclusion, interfere with counsel or hold itself out as providing legal services.

Clause 2 Conflict and confidentiality. Firm performs and records minimum-metadata conflict review before substantive access and rechecks material party/scope changes. Firm may accept a conflict only where professional rules permit and required informed consents are obtained. Counsel controls privilege classification and authorized recipients. NOVAR shall apply case/matter restrictions; Firm shall not disclose client privileged information to NOVAR/partners merely because they pay or coordinate the matter. Accidental disclosures are reported immediately for counsel-directed response.

Clause 3 Client engagement and fees. A separate matter letter is required before legal work. Legal fees belong exclusively under the firm/client agreement and are routed separately. No percentage legal-fee

sharing or paid referrals to nonlawyers unless expressly permitted and approved; default prohibited. Third-party payment requires client consent and independence under applicable rules. Trust accounts are administered only by firm/authorized custodian; NOVAR has no discretionary transfer authority.

Clause 4 Operations and withdrawal. Firm shall acknowledge/review within accepted schedule, flag deadlines and coverage gaps, preserve evidence, use secure channels and escalate inability to meet deadlines. Withdrawal/termination follows professional obligations and client notice/consent rules; no abrupt deadline abandonment because platform subscription ends. Successor handoff requires client authority and privilege/conflict safeguards.

Matter letter required fields: exact client(s) [ ]; matter/asset/jurisdiction [ ]; responsible lawyer [ ]; scope and exclusions [ ]; conflict clearance/waivers [ ]; fee basis/estimated costs [ ]; payer and third-party consent [ ]; trust treatment [ ]; communication and permitted platform recipients [ ]; response/deadline schedule [ ]; retention/file access [ ]; termination/withdrawal [ ]; grievance/dispute requirements [ ]; client and lawyer signatures [ ]. No "Owner/Heir Assistant" click alone creates representation.

K.3 Source access and data license form

Parties: [source legal owner/licensor] and [ENT-OP licensee]. Dataset/workflow/official endpoints [ ]; contract priority/terms [ ]; class [ ]; permitted geography/entities/users [ ]; effective/expiry/renewal [ ]; fees [ ]; support and incidents [ ]. Public-source terms may serve instead of a negotiated license only after documented counsel/Compliance approval; this proposed form never grants rights without source authority.

Clause 1 Grant and restrictions. Licensor grants only the listed retrieval, internal use, permitted derived works and downstream-sharing rights during term. Automation method, authentication, rate/burst/concurrency and retries are set in the technical schedule. No login/CAPTCHA/circumvention, resale, redistribution, AI training or sensitive-field use beyond express rights. Attribution, masking, purpose, retention and recipient conditions apply to raw and derived outputs as specified. Subsidiaries/SPVs/subprocessors are not automatically licensees.

Clause 2 Publication corrections and evidence. Source identifies dataset coverage, known release/correction pattern, stable keys and available completeness evidence without guaranteeing unsupported timing. NOVAR preserves authorized provenance/version/hash, processes revisions and removes/updates dependent records under agreed conditions. Parties designate incident contacts and correction notifications. No third-party estimate is mislabeled official source data.

Clause 3 Data stewardship and audit. NOVAR enforces rights at fetch/share/export and keeps compliance evidence. Licensor audit rights are [notice/scope/frequency] without disclosure of unrelated claimant/privileged data. Sensitive fields, privacy obligations, retention maximum/minimum, lawful hold handling and deletion attestations are expressly scheduled. If a legally required preservation conflicts with source deletion, parties escalate to counsel and suspend conflicting use; no hidden indefinite retention.

Clause 4 Change termination and remedies. Material terms/rights changes require notice [period] where agreed; NOVAR may pause immediately on ambiguity/expiry. On termination access and sharing cease as required, authorized retained evidence is restricted, downstream copies are recalled/deleted where required and completion certified. Renewal is written; no assumed continued rights. Source representations of authority [ ]; service/accuracy limitations [ ]; liability/indemnity [ ]; law/venue [ ]; statutory public-agency limitations [ ]; authorized signatures [ ]. Attach executed rights and technical

schedules/DRR.

K.4 Vendor services agreement and data processing addendum

Parties: [ENT-OP controller/business] and [vendor legal entity processor/service provider]. Services/SOW [ ]; data/purpose/subject categories [ ]; processing locations including support [ ]; approved subprocessor list [ ]; security requirements [ ]; service/fees/insurance [ ]; contacts [ ]; term/exit [ ]; law/venue [ ]. Legal determines each party's actual controller/processor role; labels do not override facts.

Clause 1 Instructions and restrictions. Vendor processes personal/confidential data only on documented NOVAR instructions for listed services and purposes. No advertising, sale, unrelated profiling, external training, vendor model improvement or unauthorized prompt/log retention. Vendor shall notify NOVAR if instructions appear unlawful and suspend the disputed action pending resolution. Vendor provides assistance for rights requests, PIA/regulator inquiries, corrections, legal holds and deletion.

Clause 2 Security and personnel. Require least privilege, MFA, encryption, secrets management, secure SDLC, logging, tested incident/DR response and confidentiality/training. Vendor restricts access to approved personnel, locations and purpose, including remote support. No foreign access without prior written approval and transfer analysis. Insurance floors and exclusions are reviewed. Independent security evidence, penetration-test summaries and remediation status supplied before onboarding and annually; security audit rights permit proportionate verification.

Clause 3 Subprocessors and notice. Only listed approved subprocessors may receive data; vendor imposes equivalent contractual restrictions and remains accountable. Provide at least 30 days prior notice of planned new subprocessors where legally/operationally possible; NOVAR may reasonably object and stop affected processing pending resolution. Vendor notifies suspected security/privacy incident affecting NOVAR within 24 hours of discovery and provides known facts, scope, containment and ongoing updates without waiting for full investigation. Legal notification obligations may be faster; neither party makes unauthorized public/client notices.

Clause 4 Retention exit and compliance. Retention follows exact schedules and source limitations; backups/time to deletion disclosed. At expiry/termination return usable data and then delete live/derived/cache/vector copies and subprocessors, including backup expiry plan, except specific lawful preservation restricted to necessary scope. Supply deletion certificate and evidence. No lien on claimant documents or security access that prevents lawful handoff. Payment vendor SOW additionally defines custody/licensing, screening/KYC responsibility, account-change and two-person controls, disputes, settlement/reconciliation and funds return; provider does not acquire unilateral authority over claimant funds from a generic DPA.

Clause 5 Commercial enforcement. Service levels/credits [ ]; audit/remediation [ ]; liability/cyber/privacy indemnity allocation [ ]; compliance cooperation [ ]; termination for unsafe/unlawful processing [ ]; business continuity/portability [ ]; dispute process [ ]; signatures [ ]. Attach PIA, architecture, approved subprocessors, financial flow if applicable and named incident contacts. Contracts must reflect actual purchased provider capability; unavailable control blocks integration rather than being assumed.

K.5 Claimant assistance agreement required form controls

Parties: [ENT-OP] and [identified claimant/authorized representative]; property/official record [ ]; factual match scope and no-entitlement guarantee [ ]; exact optional nonlegal assistance [ ]; claimant's official direct/free claim route [ ]; fee basis/rate/cap/dollar estimate/payment trigger [ ]; separate counsel engagement/fees [ ]; expense authorization [ ]; cancellation/waiting period [ ]; privacy/communications [ ]; signatures/notary/authority [ ]; complaints/notices [ ]. No assignment of owner funds, power of attorney or deposit custody unless exact workflow law and separate authority explicitly permit it. Texas workflow form must satisfy every applicable statutory agreement condition after counsel review; this checklist is not a substitute for that form.

K.6 Execution acceptance

Legal-approved template + exact jurisdiction/workflow schedules + named licensed entity/signatory + completed mandatory fields + required disclosures/consents + verified execution/e-sign evidence + stored hash/version are required. Track renewals/termination and dependent access. Source/DPA must be executed before data transfer; attorney matter before advice; partner MSA/order/assignment before case access; claimant agreement before paid assistance as law requires. Unsigned templates may support development but cannot be marked contractual acceptance evidence.

Appendix L Official References and Open Launch Decisions

L.1 Official references checked September 30 2026

These references ground the limited legal facts stated in this addendum. They are not a complete 50-state legal survey. Counsel must retrieve current text/effective dates and create exact workflow memoranda. Other thresholds and operating periods in this document are proposed NOVAR controls.

R1 Texas Legislature, Property Code Chapter 74, particularly Section 74.507 recovery assistance and agreement conditions. Official text: https://tcss.legis.texas.gov/resources/PR/htm/PR.74.htm . Scope: the recovery-fee example and legal-memo trigger; do not extend to every asset/workflow.

R2 Texas Secretary of State, Data Brokers. https://www.sos.state.tx.us/statdoc/data-brokers.shtml . Current page identifies Business and Commerce Code Chapter 510 and registration, notice and security-program requirements. Applicability depends on NOVAR's actual data practices, not the platform name.

R3 FinCEN, Money Services Business Registration. https://www.fincen.gov/resources/money-services-business-msb-registration . Used as a classification-review starting point; actual federal/state duties and exemptions require counsel analysis of funds flow.

R4 OFAC, A Framework for OFAC Compliance Commitments. https://ofac.treasury.gov/media/16331/download?inline . Used for risk-based sanctions program design; current program/list/ownership/recordkeeping rules must also be checked in transaction review.

R5 Texas Attorney General, Texas Data Privacy and Security Act. https://www.texasattorneygeneral.gov/consumer-protection/file-consumer-complaint/consumer-privacy-rights/texas-data-privacy-and-security-act . Used to identify the need for scoped privacy/rights review; NOVAR's applicable obligations and exemptions require counsel determination.

R6 Texas Comptroller, Unclaimed Property program. https://comptroller.texas.gov/programs/unclaimed/ . Program and ClaimItTexas identification only; no API permission, release cadence, automation license or full dataset availability is inferred.

L.2 Decision register no fabricated approvals

Blocking decision	Owner	Required resolution
Exact existing NOVAR legal name and authority	Legal + controller	Incorporation/standing/EIN/signers/IP chain; alternate names resolved
Registration licenses and insurance	Legal + broker	Completed Texas scope tracker, broker classification, bound policies and license/bond evidence or reasoned nonrequirement
Automated official Texas source	Compliance + Engineering	Exact authorized endpoint/file, written rights/terms, schedule and complete certification; otherwise automation off
Texas legal and claimant forms	Texas counsel	Current Section 74.507 and all other workflow analysis, executed approved forms, compensation and outreach rule IDs
Identity bank sanctions and payment vendors	Operations + Finance + Security	Named approved vendors, DPAs, regions/retention, coverage and control tests
Identity provider cloud KMS SIEM and AI provider	Engineering + Security	Signed architecture decisions, contracts, regions, keys, isolation and evaluation proof
Privacy contacts and notices	Privacy + Legal	Real intake/appeal/contact routes and legal disclosures; consent and broker determinations
Named people coverage and budget	Executive + Operations + Finance	Committee/on-call/attorney roster, independent approvers, authorized budget and risk floors
Production launch	All committee domains	All B1-B8 and Appendix J evidence current; charter caps/rollback; signed release

L.3 Adoption record

Baseline adopted by [board/authorized executive] on [date]; version/hash [ ]; policy owner [ ]; next annual review [ ]; domain approvers [ ]; training due [ ]; exception register [ ]. Before adoption, engineering may use this as a reviewable specification with synthetic data. After adoption, all mandatory controls are enforceable; production remains blocked until scoped release approvals exist. An adopted policy is not evidence that a license, source permission or verification has been obtained.
