AI Tax Business Operating System

Master Platform Blueprint & Complete Developer Specification

Marketing, Product, Technology, Revenue, Compliance & Growth

> ***Pitch:*** *Upload your documents. Your Tax AI becomes the expert and handles the rest.*

Part	Contents
Master Blueprint	Sections 1-32: vision, channels, pricing, product, operations, compliance, marketing, roadmap
Addendum A	True Developer Build Specification (A1-A18)
Addendum B	AI Tax Resolution Center - Developer Specification (B1-B10)
Addendum C	Upload & Done Experience Enhancements (C1-C10)
Addendum D	Facebook & Instagram Marketing Plan (D1-D19), including alignment additions
Addendum E	Completeness Review: overlooked items and adjustments (E1-E5)

Master Platform Blueprint

Marketing, Product, Technology, Revenue, Compliance & Growth

Executive Vision

Build one AI-first, cloud-based tax ecosystem serving direct taxpayers, PTIN preparers operating within the firm's authorized structure, independent EFIN tax offices, business-tax professionals and service bureaus. The product combines personal tax, business tax, secure cloud records, role-specific personal AI assistants, professional workflow, education, expert escalation, e-file infrastructure, bank-product workflow and year-round business services.

> ***North Star:*** *Whether someone needs to file taxes, prepare taxes for others, or operate an entire tax company, the platform should carry the authorized work from document intake through calculation, professional review, signature, e-file, post-filing support and next year's return.*

1. Customer Channels

Channel	Commercial relationship	Core experience
Direct taxpayer	Pays preparation/service fees	Upload-and-verify tax preparation with personal Tax AI.
PTIN preparer	Works through properly structured firm/network	AI-assisted preparation, education, client workflow, compensation and expert escalation.
Independent EFIN office	Licenses software; keeps own EFIN, clients and pricing	White-label professional tax-office OS for personal and/or business tax.
Business-tax professional	Licenses business capability	Entity returns, accounting/tax workpapers, K-1s, basis, depreciation, diagnostics.
Enterprise/service bureau	Custom commercial agreement	Multi-office management, white label, billing, analytics, compliance and integrations.

2. Product Packaging & Premium Pricing

Initial positioning uses a premium strategy: benchmark the high end of established professional software and charge approximately 15% more when the platform can demonstrate meaningful labor savings, guided education, personal AI assistants, document automation, cloud Tax Vaults and workflow consolidation. Final pricing must be revalidated immediately before launch.

Package	Illustrative list price	Primary capability
Personal Pro	$2,795/year	Professional 1040 platform, Schedule C/E, states, amendments, AI, Tax Vault, e-file workflow, office tools.
Business Pro Only	$2,495/year proposed	1065, 1120-S, 1120, K-1s, business states, trial balance, depreciation, basis and business AI.
Complete Personal + Business Pro	$3,795/year	Combined professional personal and entity-tax operating system.
Enterprise / Service Bureau	Custom	Multi-office, high-volume, custom branding, integrations and commercial terms.

Tax-office software pricing is separate from taxpayer preparation pricing. Independent EFIN offices set their own client fees. PTIN-network economics are governed by the firm's compensation model. Direct taxpayers pay the platform/firm's consumer preparation prices.

3. Personal Tax Division

Support the 1040 family and major schedules/credits: wage income, dependents, itemized deductions, Schedule C, Schedule E, investments, retirement, education, credits, estimates, amendments, prior years and state returns. The consumer interface should hide tax-form complexity whenever possible and ask plain-language questions tied to verified source documents.

4. Business Tax Division

Business tax is a separate product and workflow, not a more expensive 1040. Commercial core: 1065 partnerships, 1120-S S corporations and 1120 C corporations, with K-1 integration into owner returns. Add business states, balance sheets, depreciation, partner/shareholder basis, payroll reconciliation, owner compensation, distributions, loans, fixed assets, book-to-tax adjustments and trial-balance mapping. Later specialty expansion can include 1041, 990, 706, 709 and 5500.

Business preparation pricing should be complexity-aware. The quote engine can consider entity type, revenue, owners, states, payroll, fixed assets, quality of books, unreconciled accounts, prior-year availability and cleanup requirements. Bookkeeping cleanup/reconstruction is priced separately from return preparation.

5. Every User Gets a Personal AI Assistant

Assistant	Authorized role
Taxpayer AI	Collect documents, explain missing items, answer status questions, explain results and guide authorized tax workflow.
Preparer AI	Prepare faster, explain tax concepts, surface unresolved returns, guide personal/business workflows and recommend escalation.
Business Owner AI	Understand authorized business tax/accounting history, readiness, estimates, planning tasks and entity-to-owner relationships.
Tax Office AI	Office pipeline, revenue, staff workload, rejections, unsigned returns, bank-product reporting and operational alerts.
Platform Admin AI	Tenant operations, support, compliance analytics, fraud/risk signals and system health without unrestricted taxpayer browsing.

The AI layer is permission-aware context over shared models - not a separate model per user. AI can extract, classify, explain, interview and propose. Deterministic tax rules remain authoritative for calculations.

6. Guided Business-Tax Education & Expert Desk

A preparer who is strong on 1040 work but inexperienced with entity returns can enter Guided Business Preparation. The assistant explains each concept in context, shows documents/evidence, identifies risk, and teaches why the tax treatment matters. Escalation states: AI Guided -> Preparer Review -> Expert Review -> Expert Preparation. Client attribution, assignment, compensation and audit history persist through escalation.

7. Secure Cloud Tax Vault

Client files remain available inside the authorized tax-office portal while the underlying records are stored in encrypted cloud infrastructure. Organize by taxpayer, business entity and tax year. A unified client graph links entity returns to owners - for example, an S-corporation return produces a K-1 that feeds the owner's 1040 workflow.

8. Document Intelligence

Pipeline: upload -> malware scan -> document classification -> extraction -> validation -> tax-year assignment -> taxpayer/entity matching -> tax-field mapping -> confidence score -> verification. Support W-2/1099/1098 families, brokerage documents, IDs, bank/credit statements, prior returns, P&L, balance sheet, trial balance, general ledger, payroll, fixed assets, loan records and supporting business documents.

9. Canonical Tax Data Graph

Do not build the application around PDFs. Model taxpayer, household, dependents, employment, businesses, ownership, income, expenses, assets, payroll, investments, property, credits, payments, carryforwards, filings and evidence as structured data. Tax forms are generated from facts + tax rules.

10. Deterministic Tax & Forms Engine

Version rules by tax year and jurisdiction. Same facts + same engine version must reproduce the same result. Maintain calculation provenance, tax-law/rule version, overrides and reviewer approvals. Build personal and business engines as modular services that share the canonical data model.

11. Accounting, Bookkeeping & Reconstruction

Normalize bank, card, accounting and payroll data; reconcile receipts; classify expenses; create tax-ready workpapers; map trial balances; maintain fixed-asset schedules; identify shareholder/partner transactions; and support book-to-tax adjustments. Multi-year reconstruction compares source records to originally filed returns and creates an amendment/review package without silently changing filed data.

12. Tax Planning & Scenario Engine

Year-round business clients should receive estimated-tax projections, year-end income projections, planning scenarios, payroll/distribution reviews, depreciation scenarios and readiness alerts. Scenario branches never overwrite the live return; each runs through the same deterministic engine and records assumptions/results.

13. CRM, Communications & Virtual Office

Build automated document requests, SMS/email/app reminders, unsigned-return reminders, appointment scheduling, intake questionnaires, extension reminders, estimated-payment reminders, rejected-return notices, client messaging, queue management and annual organizers. This reduces dependence on a separate CRM.

14. Practice Management

Office owners need preparer permissions, multiple locations, return queues, compensation, productivity, turnaround time, lead source, conversion, client retention, revenue, outstanding invoices, return quality and error metrics. Independent EFIN offices see only their authorized tenant data.

15. Rejection Intelligence

Translate federal/state reject codes into plain language, identify affected data, explain likely resolution steps, route tasks to the correct preparer/client and preserve the original acknowledgment. The goal is not merely to display a code but to turn a rejection into an actionable workflow.

16. Fraud & Identity-Theft Controls

Risk engine should detect duplicate identifiers, suspicious bank-account reuse, altered documents, device/account anomalies, unusual refund patterns, EFIN misuse, suspicious preparer behavior and abnormal filing patterns. High-risk events trigger review rather than automatic filing.

17. Credential & Compliance Center

Track EFIN office identity, PTINs, preparer roles, state requirements, training/certification, bank enrollment, agreements, signature authorization, compliance tasks and expiration dates. EFINs are firm-specific credentials and must never be treated as interchangeable login credentials.

18. Consent & Tax-Data Permission Engine

Every use/disclosure of tax-return information must have a recorded purpose and legal basis. Track preparation use, support, planning, AI processing, third-party services and any non-preparation use separately. Record consent text/version, taxpayer action, scope, effective/expiration dates and revocation where applicable. Do not assume tax data may automatically be reused to market unrelated services.

19. E-file Architecture

V1 should favor proven licensed/integrated tax calculation and transmission infrastructure while the company builds its differentiated AI, document, workflow, education and office layers. Long term: completed return -> diagnostics -> signature authorization -> IRS schema/XML -> MeF validation -> transmitter -> acknowledgment -> accepted/rejected. IRS provider roles such as ERO, Intermediate Service Provider, Software Developer and Transmitter must be reflected correctly in architecture and contracts.

20. Payroll & Information Returns

Business expansion should include payroll/information-return workflows: W-2/W-3, 1099-series and employment-tax filings such as 941/940 where commercially justified. Treat employment-tax e-file as its own technical/compliance workstream, not merely another form screen.

21. Bank Product Integration

Create a provider-neutral abstraction for refund transfers, advances where offered/approved, direct deposit, checks and cards. Bank/financial partners control underwriting/approval for their products. Enrollment, disclosure, consent, provider fees and settlement events remain distinct from tax calculations.

22. Billing, Compensation & Revenue Ledger

Track software subscriptions, per-return technology charges, AI/document usage, tax-preparation fees, preparer compensation, expert review/preparation, reconstruction, bookkeeping, tax planning and permitted bank-product/service-bureau economics. Maintain a real ledger rather than calculating commissions from ad hoc reports.

23. IRS Notices, Audits & Post-Filing Support

Allow taxpayers to upload IRS/state notices. AI identifies notice type, affected tax year/return, response deadline and required documents, then creates a workflow. Representation matters escalate to appropriately credentialed professionals. Maintain authorization workflows such as applicable power-of-attorney or information authorization documents.

24. Expert Marketplace / Network

Create a controlled internal marketplace for business-tax specialists, bookkeeping cleanup, expert review and authorized representation. This allows preparers to retain relationships without pretending every preparer can handle every issue.

25. Migration - 'Move My Tax Office'

Switching cost is a major sales barrier. Build supported import/migration for client demographics, prior-year tax data/returns where technically and contractually permitted, depreciation/carryforward data, preparer lists, documents and pricing. Offer assisted migration as a founding-office incentive or premium onboarding service.

26. Security Baseline

Encryption in transit/at rest, tenant isolation, MFA, RBAC/ABAC, key management, secrets management, WAF/rate limiting, malware scanning, PII masking/tokenization, just-in-time support access, immutable audit logs, encrypted backups, disaster recovery, retention/deletion policies, incident response and eventual SOC 2 Type II readiness. Build a Written Information Security Plan process into the operating model.

27. Auditability & Provenance

Log who viewed/changed data, source document, extraction confidence, AI recommendation, user override, prior/new value, tax-engine version, reviewer approval, signature, transmission, acknowledgment, bank-product action, compensation event and administrative access. Every material tax number should be traceable to source evidence or an explicit user/preparer entry.

28. Marketing & Acquisition System

Maintain four distinct Meta funnels: EFIN tax-office owners, PTIN preparers, direct taxpayers and business owners. Professional advertising should lead with labor/capacity improvement rather than price. Demonstrate upload -> AI reads -> AI organizes -> preparer verifies -> client signs -> e-file workflow. Use retargeting and audience-specific landing pages.

29. Development Roadmap

Phase	Build
V1 - Personal / Tax Office OS	1040 + Schedule C, personal AI assistants, intake, Tax Vault, taxpayer/preparer/EFIN portals, CRM basics, e-sign, integrated tax/e-file infrastructure, bank products, billing.
V2 - Business	1065, 1120-S, 1120, K-1 -> 1040, accounting/trial balance import, business AI, guided education, Expert Desk, complexity pricing.
V3 - Year-round / Advanced	Prior-year reconstruction, amendments, planning/scenarios, bookkeeping readiness, notices, practice management, fraud controls.
V4 - Infrastructure independence	Expanded proprietary tax/forms engine, IRS assurance testing/approval, MeF generation/transmission, payroll/information returns, specialty forms.

30. Commercial Moat

The defensibility is the combination: personal + business tax, role-specific personal AI, cloud Tax Vault, document intelligence, deterministic calculation, guided education, expert escalation, office operations, migration, service-bureau economics, bank-product workflow, reconstruction and year-round business services. Each feature should support at least one of four outcomes: prepare faster, increase revenue, reduce errors/risk, or retain the customer.

31. Regulatory Design Notes

IRS guidance distinguishes authorized e-file provider roles and requires appropriate software/testing for direct electronic filing. Section 7216 restricts unauthorized disclosure/use of tax-return information, so the consent/permission engine is foundational. IRS security guidance for tax professionals emphasizes safeguarding taxpayer information and written security planning. These requirements should be converted into formal legal/compliance requirements before production launch.

32. Final Product Statement

> *We are not building tax forms on a computer. We are building an AI Tax Business Operating System that acquires and retains clients, understands authorized documents, structures tax facts, prepares personal and business returns, educates preparers, manages tax offices, protects tax data, supports professional review, moves approved returns through e-file, handles post-filing work, and maintains the relationship year-round.*

Reference Framework

IRS Publication 3112 (Rev. 11-2025) defines provider roles including Intermediate Service Provider and Software Developer. IRS MeF guidance explains software-developer/transmitter requirements and assurance testing. IRS Section 7216 guidance describes restrictions on disclosure/use of tax-return information and consent requirements. IRS tax-professional security resources point practitioners to Publication 4557 and Written Information Security Plan resources. Current IRS employment-tax MeF guidance treats employment-tax electronic filing as a distinct provider/software workstream.

Addendum A

True Developer Build Specification

Purpose & Handoff Rule

This addendum converts the Master Platform Blueprint into an execution specification for the lead developer or technical owner. The Master Blueprint remains the product and business source of truth. This addendum defines the systems, screens, data objects, APIs, permissions, workflows, milestones and acceptance criteria required to turn that vision into software.

> ***Build principle:*** *Deliver a narrow, production-quality V1 first. Do not attempt every tax form, state, bank product, payroll feature and proprietary IRS transmitter simultaneously. Architect for expansion while keeping the first supported filing path controlled, testable and auditable.*

A1. System Boundaries

Module	Responsibility
Identity & Tenant	Authentication, MFA, tenant isolation, roles, office hierarchy, assignments, sessions and device/risk context.
Client / CRM	Leads, taxpayers, businesses, contacts, appointments, messages, tasks, organizers and engagement state.
Tax Vault	Encrypted document storage, metadata, versions, permissions, retention and access logs.
Document Intelligence	Classification, extraction, confidence, provenance, validation and human-verification queue.
Tax Data Graph	Canonical taxpayer/business facts independent of rendered forms.
Tax Engine Adapter	Stable interface to licensed V1 tax engine; later replaceable by proprietary deterministic engine.
Workflow Engine	Return states, tasks, approvals, signatures, escalation, e-file status and exceptions.
AI Agent Gateway	Role-scoped context, retrieval, tool authorization, model/version logging and safety controls.
Billing / Ledger	Subscriptions, invoices, prep fees, compensation, expert fees, usage, reversals and adjustments.
E-file / ACK	Transmission adapter, acknowledgments, reject parsing and resolution status.
Bank Products	Provider-neutral enrollment, disclosures, selections and settlement status.
Compliance / Audit	Consent, credential tracking, immutable events, fraud/risk review and controlled support access.

A2. Roles & Authorization

Role	Minimum authorized scope
Platform Super Admin	Platform and tenant configuration. Taxpayer-document access is not granted by default.
Compliance / Risk	Credential, consent, fraud and audit cases with controlled case-based access.
Support	Operational metadata by default; just-in-time audited client-data access only when authorized.
EFIN Owner	Authorized office clients, staff, returns, billing, pricing, reporting and settings.
Office Manager	Office workflow and assigned administrative functions; configurable financial visibility.
Signing Preparer	Assigned returns, facts, documents, diagnostics, approvals, signatures and filing actions.
Reviewer / Expert	Assigned review/escalation cases and supporting evidence.
Bookkeeper	Authorized accounting records; no filing authority unless separately granted.
Taxpayer	Own household/entities, documents, questions, signatures, invoices, status and final records.

Every API request must evaluate tenant + authenticated user + role + object relationship + explicit permission. Hiding a button in the user interface is not authorization.

A3. Required V1 Screens

Area	Required screens
Public / Sales	Landing, pricing, demo request, office signup and taxpayer signup/login.
Taxpayer	Home/status, personal AI, profile/household, upload, organizer/questions, messages, review summary, signatures, payment and Tax Vault.
Preparer	Dashboard, client list, return workspace, source documents, extraction verification, interview, diagnostics, AI assistant, escalation, signature and e-file status.
EFIN Owner	Office dashboard, staff/roles, client pipeline, office pricing, billing, return/reject status, bank-product status, analytics and settings.
Platform Admin	Tenant management, compliance cases, risk queue, support cases, audit search, feature flags and system status.

A4. Canonical Data Objects

Object	Required relationships / data
Tenant / Office	tenant_id, legal/brand name, EFIN metadata, locations, settings, subscription and feature flags.
User / Role	user_id, tenant_id, grants, PTIN/credential metadata, MFA and assignments.
Taxpayer / Household	identity tokens, contact, filing facts, spouse, dependents and consent records.
Business Entity	entity type, EIN token, ownership, tax year, states, accounting method and owners.
Engagement / Return	tax year, return type, preparer, reviewer, workflow state, engine version and filing state.
Document	owner, tax year, type, storage key, checksum, version, extraction status and provenance.
Tax Fact	fact type, value, source, confidence, tax year and override history.
Task / Event	assignee, due date, state, reason, related return/client and escalation.
Consent / Signature	document/version, scope, signer, timestamp, evidence and status.
Transmission / ACK	submission id, EFIN context, schema version, timestamps, status and reject codes.
Ledger Entry	payer/payee, category, amount, source, return/client and reversal relationship.
Audit Event	actor, tenant, object, action, before/after references, device context and timestamp.

A5. Return State Machine

> *Lead -> Client Created -> Engagement Accepted -> Intake Started -> Documents Pending -> Extraction/Verification -> Tax Facts Ready -> Calculation -> Diagnostics -> Preparer Review -> Expert Review (optional) -> Client Review -> Signature Pending -> Ready to File -> Transmitted -> Accepted / Rejected -> Post-Filing -> Closed.*

Rejected returns enter a resolution workflow and may return to Ready to File only after the issue is resolved and required approvals are complete. Every state transition records actor, timestamp, reason and relevant engine/workflow version.

A6. Document-to-Return Workflow

Step	System behavior	Human gate
Upload	Scan, checksum, encrypted storage, tenant/client association.	Reject unsafe or unusable files.
Classify	Identify document family, tax year and likely taxpayer/entity.	Low confidence enters review.
Extract	Capture fields with page/source provenance and confidence.	Conflicts or low confidence require verification.
Reconcile	Compare income/business records against other known sources.	Material differences create diagnostics.
Map	Write verified facts to canonical tax graph.	AI cannot silently change verified facts.
Calculate	Send supported facts to deterministic engine/adapter.	Blocking diagnostics prevent filing.
Review	Preparer/reviewer resolves flags and approves.	Professional approval when required.
Sign / File	Capture authorization and transmit.	No transmission without required signatures/credentials.

A7. AI Agent Technical Contract

AI agents use authorized tools and services rather than unrestricted database access. Context is constructed from the user's role, tenant, assigned client/return, approved documents, tax year, workflow state and permitted knowledge. Log model/version, material tool calls, retrieved object references, recommendation and user acceptance/override.

AI may	AI may not
Extract/classify; explain; ask missing questions; summarize authorized records; propose facts; create task suggestions; explain rejects; draft communications.	Be the authoritative tax calculator; bypass permissions; transmit returns; approve its own high-risk advice; silently alter verified facts; expose another tenant; invent evidence.

A8. API & Integration Contract

Use versioned service APIs. Recommended resource families: /auth, /tenants, /users, /clients, /businesses, /engagements, /returns, /documents, /extractions, /tax-facts, /calculations, /diagnostics, /tasks, /messages, /consents, /signatures, /efile, /bank-products, /billing, /credentials, /risk, /audit and /reports. Use idempotency keys for payment/transmission operations and signed webhooks for external events.

Wrap external vendors behind adapters: tax/e-file engine, e-sign, payment processor, messaging, bank products, accounting/payroll, identity/fraud and AI model providers. Vendor-specific fields should not become the canonical tax domain model.

A9. Security Engineering Acceptance

Control	Minimum acceptance
Tenant isolation	Automated tests prove cross-tenant object access is denied at API/data-policy layer.
MFA	Required for professional/admin roles; recovery is logged and risk-controlled.
Encryption	TLS in transit; managed encryption at rest; sensitive identifiers masked/tokenized where practical.
Secrets	No secrets in source code or client bundles; centralized secret management and rotation.
Support access	Just-in-time, reason-coded, time-limited and auditable.
Audit logs	Append-only/immutable strategy; searchable by tenant, user, client and return.
Backups / DR	Encrypted backups, tested restoration and defined production RPO/RTO.
Uploads	Malware scanning, file validation, limits and quarantine.
Logging	Never log full SSNs, passwords, bank credentials or raw sensitive documents.

A10. V1 Definition of Done

> *V1 is production-ready only when a supported individual-return client can be created, upload documents, have data extracted and verified, answer missing questions, receive deterministic calculation through the integrated engine, resolve diagnostics, review/sign, pay where applicable, transmit through the authorized e-file path, receive an acknowledgment, resolve a supported reject, and retain final records in the Tax Vault - with tenant isolation, permissions and audit history functioning end to end.*

Capability	Acceptance criterion
Office onboarding	Create tenant, office owner, preparers, roles, supported credential metadata and subscription.
Client onboarding	Taxpayer securely enters/accepts engagement and completes identity/contact/household intake.

Capability	Acceptance criterion
Documents	Supported forms upload, classify, extract and display provenance/confidence for verification.
Return workspace	Facts, documents, questions, diagnostics, calculation and review state in one workspace.
AI	Taxpayer/preparer assistants use only authorized context and cannot bypass filing gates.
E-sign	Required signature workflow captured with evidence and status.
E-file	Supported return transmits through integrated provider; ACK/reject state persists.
Billing	Subscription and preparation/payment events reconcile to ledger.
Security	Critical events logged and cross-tenant security tests pass.

A11. Build Order & Milestones

Milestone	Deliverable
M0 - Architecture	Threat model, tenant model, ERD, vendor decisions, environments, CI/CD, observability and feature flags.
M1 - Identity + CRM	Authentication/MFA, tenants/roles, office setup, taxpayer/business records, engagements, tasks/messages.
M2 - Tax Vault	Secure upload/storage, metadata, classification/extraction, verification UI and provenance.
M3 - Tax Core	Canonical graph, tax-engine adapter, 1040/Schedule C mapping, calculations and diagnostics.
M4 - AI Assistants	Permission-aware taxpayer/preparer AI, tool gateway, education and workflow assistance.
M5 - Review / E-file	Review gates, e-sign, transmission adapter, acknowledgments and reject workflow.
M6 - Billing / Office	Subscriptions, prep payments, office dashboard, ledger, analytics and compensation hooks.
M7 - Pilot Hardening	Security/load/DR testing, audit validation, pilot offices and defect remediation.
M8 - Business Tax	1065/1120-S/1120, K-1 -> 1040, trial balance, business AI and Expert Desk.

A12. Engineering Non-Negotiables

1. Never mix tenant data.

2. Never allow AI output to replace deterministic tax calculation.

3. Never transmit without required credentials, diagnostics and signatures.

4. Preserve source provenance for material extracted facts.

5. Do not hard-code one e-file, bank, AI or payment vendor into the domain model.

6. Never overwrite filed-return history; amendments and reconstruction are versioned.

7. Support staff do not have universal taxpayer access.

8. Production tax rules and integrations are versioned and auditable.

A13. Lead Developer Deliverables Before Production Coding

Deliverable	Required output
Architecture Decision Record	Chosen stack, cloud, database, object storage, queue/events, observability, deployment and rationale.
ERD / Domain Model	Tenant, user, taxpayer, business, return, document, facts, tasks, consent, filing, ledger and audit relationships.
Permission Matrix	Every role x major object/action, including exceptional support/compliance access.
API Specification	Versioned endpoints/events, auth, idempotency, webhook verification and error model.
Vendor Matrix	Tax/e-file engine, e-sign, payments, messaging, bank products, accounting/payroll, identity/fraud and AI.
Threat Model	Assets, trust boundaries, attack paths, abuse cases, controls and incident assumptions.
V1 Scope Map	Exactly supported return types, forms/schedules, jurisdictions, document types and excluded cases.
Test Strategy	Unit, integration, tax-regression, permissions, security, load, disaster recovery and end-to-end filing tests.

A14. Test & Quality Strategy

Maintain golden tax cases for every supported tax year and return type. Each case stores inputs, expected calculation, expected forms/diagnostics and engine version. Run regression tests whenever rules, mappings or vendor integrations change. Separately test AI behavior because correct tax calculation does not prove correct AI explanation.

Test family	Examples
Tax regression	Known 1040/Schedule C cases, credits, phaseouts, carryovers, edge cases and amendments.
Permission	Cross-tenant denial, unassigned-client denial, role escalation, support-access expiry.
Document	Duplicate upload, corrupt file, altered file, low confidence, conflicting W-2/1099 data.
Workflow	Missing signature, blocking diagnostic, reject/resubmit, reviewer escalation, cancellation.
AI	Unauthorized-data prompts, hallucinated evidence, unsafe tool request, explanation consistency, override logging.
Reliability	Queue retries, webhook duplication, provider outage, backup restore, partial transmission failure.

A15. Production Operations

Create separate development, staging and production environments. Production access is least-privilege and audited. Use structured logs, metrics, traces, alerting, error tracking, job/queue monitoring, vendor-health monitoring and tax-season capacity dashboards. Critical third-party outages need graceful degradation and a visible operational status for staff.

A16. Feature Flags & Tax-Year Versioning

Features must be enableable by tenant, user cohort, tax year and environment. Tax rules, document mappings, interview logic, diagnostics and e-file schemas must carry explicit versions. A return already prepared under one version cannot silently change because a later deployment modifies rules.

A17. Business-Tax Expansion Contract

After V1 proves the individual workflow, add business entities without rebuilding the platform. Reuse identity, documents, AI gateway, workflow, billing, audit and security. Extend the canonical graph for ownership, capital/basis, payroll, fixed assets, trial balance, book-to-tax adjustments and K-1 relationships. Entity K-1 output must connect to the owner's personal-return facts with traceable provenance.

A18. Handoff / Governance

The lead developer owns technical decomposition, architecture decisions, implementation estimates and engineering execution. Product ownership retains authority over pricing, supported customer models, compliance posture, user experience and business requirements. Material scope changes should be documented in an Architecture/Product Decision Log so the single handoff document remains authoritative as the product evolves.

> ***Developer Handoff Statement:*** *Read the Master Blueprint first for the full business/product vision. Use Addendum A as the execution contract. Before major coding begins, return the architecture decision record, ERD, permission matrix, V1 scope map, vendor matrix, API specification, threat model, milestone estimate and test plan for approval. Then build milestone by milestone, preserving the non-negotiables above.*

Addendum B

AI Tax Resolution Center - Developer Specification

Purpose

Add a post-filing tax-resolution module for clients with balances across one or multiple tax periods. The module must organize assessed balances by year, separate tax/penalty/interest, identify unresolved filing periods, collect financial information, compare available resolution pathways, create professional-review tasks, track the selected arrangement, and preserve the full case history.

> ***Critical rule:*** *The platform does not combine tax years into a new loan or promise a settlement. It presents the taxpayer's liabilities and available resolution workflows. Eligibility, final terms and acceptance remain subject to the taxing authority and, where required, professional review.*

B1. Resolution Case Workflow

Stage	Required system behavior
1. Tax Compliance Check	Identify filed/unfiled years, current-year filing status, estimated-payment/current-compliance issues and missing account data.
2. Liability Assembly	Create year-by-year balance records for assessed tax, penalties, interest, payments/credits and total balance.
3. Transcript / Evidence Review	Store authorized transcripts/notices/account records and link each balance to its source and retrieval date.
4. Relief Screening	Flag potential penalty-relief, installment, partial-pay, hardship or offer-review pathways for professional evaluation.
5. Financial Intake	Collect household income, business income, expenses, assets, liabilities and other required financial facts.
6. Scenario Comparison	Display projected payment/resolution scenarios without overwriting authoritative account data.
7. Professional Review	Route complex/representation matters to appropriately credentialed professionals.
8. Submission / Setup	Track authorized applications, forms, correspondence, submission date and agency response.
9. Monitoring	Track payments, notices, compliance requirements, review dates and case status.

B2. Resolution Dashboard

The case workspace should show a consolidated client view while preserving each tax period separately:

Dashboard component	Required information
Tax Period Ledger	Tax year/period, return type, assessment date, tax, penalty, interest, credits/payments, current balance and status.
Combined Balance	Total across included periods, with clear statement that underlying liabilities remain period-specific.
Compliance Status	Missing returns, current filing obligations, current estimated-tax/payroll obligations and blocking issues.
Relief Opportunities	Potential penalty-relief and collection alternatives requiring verification/review.

Dashboard component	Required information
Payment Scenarios	Proposed monthly amount, duration assumptions, projected remaining balance and warnings that accruals may continue.
Deadlines / Notices	Agency notices, response dates, collection deadlines where available and assigned tasks.
Professional Status	Assigned preparer, reviewer/EA/CPA/attorney where applicable, authorization status and next action.

B3. Resolution Options Engine

Pathway	System function
Pay in Full	Show balance and payment workflow/instructions; record payment evidence and resulting account update.
Short-Term Payment Plan	Screen for current eligibility rules and create application/task workflow.
Installment Agreement	Evaluate current rule thresholds and required inputs; create proposal and submission workflow.
Partial-Pay Review	Collect expanded financials and route for professional review before submission.
Penalty Relief Review	Identify potentially eligible periods/reasons and build evidence/review checklist; never guarantee abatement.
Offer in Compromise Review	Collect required financial facts and perform eligibility/pre-screen workflow; never promise acceptance.
Hardship / Collection Alternative	Collect financial data and escalate for appropriate professional analysis.

Eligibility thresholds, forms, agency procedures and calculation rules must be configuration/version controlled rather than hard-coded permanently because tax-administration rules change.

B4. New Data Objects

Object	Key fields / relationships
Resolution Case	client, tenant, taxing authority, assigned professional, status, opened/closed dates, engagement and scope.
Tax Period Liability	period, return type, assessment dates, tax, penalty, interest, payments/credits, balance, source and last verified date.
Financial Profile	household/business income, allowable/claimed expenses, assets, liabilities, dependents and source evidence.
Resolution Scenario	pathway, assumptions, proposed payment, duration, projected outcome, rule version and reviewer status.
Notice / Deadline	notice type, tax period, received date, response deadline, source document and assigned task.
Authorization	authorization type, representative, scope, tax periods, effective status and supporting document.
Agency Submission	submission type, forms/package, sent date, method, confirmation, response and status.
Resolution Payment	period/case, amount, date, method/reference and reconciliation status.

B5. AI Resolution Assistant

The personal AI assistant may explain the case in plain language, summarize balances, identify missing documents, conduct structured financial intake, compare configured scenarios, explain notices and create tasks. It may not guarantee penalty relief, settlement, acceptance of a payment plan or a specific collection outcome.

For professionals, the AI may create a case summary such as: periods involved, total verified balance, missing returns, notice deadlines, financial profile completeness, potential pathways, unresolved evidence and recommended review queue. All material figures retain source provenance.

B6. Nine-Year Reconstruction-to-Resolution Flow

> *Source documents -> reconstruct each year -> compare originally filed data -> prepare required amendments/returns -> professional review -> taxpayer signatures -> file -> wait for/verify assessments -> assemble period-by-period liabilities -> calculate combined client view -> evaluate relief/payment alternatives -> professional approval -> submit/setup selected resolution -> monitor until case completion.*

This creates a direct bridge between the existing Multi-Year Reconstruction module and the new Resolution Center. Filed-return history is never overwritten. The resolution case references the final filed/amended version for each period.

B7. Pricing & Engagement Architecture

Resolution work must be billable as a separate engagement from tax preparation/reconstruction. The billing engine should support a fixed case fee, staged project payments, professional-review fee, notice-response fee, representation fee where permitted, and recurring monitoring/service fees where appropriate. Pricing must not be calculated as a percentage of a tax refund or promised tax savings.

Engagement	Billing treatment
Reconstruction / Amendments	Separate project with defined tax years, document scope and filing deliverables.
Current-Year Preparation	Separate return-preparation line item or included project component.
Resolution Analysis / Setup	Separate case engagement after balances and filing compliance are established.
Representation / Appeals	Separate scope requiring appropriate credential/authority.
Ongoing Monitoring	Optional recurring or fixed-duration service with explicit deliverables.

B8. Permissions & Representation Controls

Taxpayer access is limited to the taxpayer's own case. Preparers see assigned cases. Representation actions require the appropriate authorization and professional role. The system must not infer that every preparer is authorized to represent a taxpayer before a taxing authority. Authorization documents, scope, periods and expiration/revocation status must be enforced by workflow permissions.

B9. Acceptance Criteria

Requirement	Definition of done
Multi-period view	System displays all included periods individually plus a mathematically correct combined balance.
Provenance	Every balance and notice links to source evidence and last-verification date.
Compliance gate	System identifies unresolved filing/current-compliance issues before resolution submission.
Financial intake	Required financial profile can be completed, saved, evidenced and reviewed.
Scenario engine	Alternative pathways can be compared without altering authoritative liability data.
Professional gate	Configured high-risk/representation cases cannot bypass required professional review.
Audit trail	Material views, changes, recommendations, submissions, approvals and agency responses are logged.
Billing	Resolution engagement and payments are distinct from preparation/reconstruction billing.
Monitoring	Case can track notices, deadlines, payment events, agency responses and next actions.

B10. Roadmap Placement

V1: Design the data model and hooks so liabilities/notices can attach to clients and tax periods. **V2:** Preserve business/entity relationships needed for owner/business resolution cases. **V3:** Launch the full AI Tax Resolution Center alongside reconstruction, amendments, notices and advanced practice management. **V4:** Deepen agency integrations, automation and rules where technically and legally appropriate.

> ***Developer Directive:*** *The Resolution Center is now a required platform module, not an unrelated future idea. Architecture created for clients, returns, documents, notices, consent, AI, billing and audit must support it from the beginning, even if the full user-facing module launches in V3.*

Addendum C

Upload & Done Experience Enhancements

Rule: Everything in the Master Blueprint, Addendum A and Addendum B stays as written. This addendum adds to it. Each item names the section it upgrades. Nothing here replaces the deterministic tax engine, credentialed preparer review, consent rules or e-file provider requirements.

> ***Design rule:*** *The user never sees a tax form, never types a number that already exists on a document, and never wonders what happens next.*

C1. The Five-Screen Experience (upgrades Sections 3, 5, 8; A3)

Screen	User does	Platform does
1. Drop Zone	Uploads anything: photos, PDFs, screenshots, forwarded emails, bundles	Runs the Section 8 pipeline, de-duplicates, links every value to its source page
2. Smart Questions	Answers only true gaps; target 10 or fewer for W-2 filers	Plain-language yes/no/photo answers tied to the Tax Data Graph (Section 9)
3. Your Result	Sees refund/owed with a 30-second explanation	Deterministic engine result (Section 10) plus readiness score and plain 'why' breakdown
4. Approve & Sign	Approves and e-signs	Auto-routes to Preparer/Expert Review (Section 6) when required, then e-file (Section 19)
5. Year-Round Home	Acts only on alerts	Notices, estimates, refund status, next year's checklist (Sections 12, 13, 23)

C2. Upload Intelligence (upgrades Sections 7, 8)

Enhancement	Description
Upload Anything Mode	Mixed, messy, multi-page bundles; glare, rotation, folds and low-light photos corrected automatically.
Auto-Fetch (consented)	With recorded consent (Section 18), retrieve employer/brokerage forms, prior returns and authorized IRS transcripts so uploads may be unnecessary.
Missing Document Radar	Compares to prior year: "Last year you had a 1099-INT from this bank. Upload it or confirm the account closed."
Forward-to-File Email	Private per-user address; forwarded tax emails and receipts land in the Tax Vault after malware scan.
Receipt Snap	Year-round capture with automatic expense categorization for Schedule C and business clients (Section 11).
Text-Link Client Upload	Offices send a text link; client uploads from phone with no account-setup friction.

C3. The Expert Brain (upgrades Sections 5, 10, 12, 27)

Enhancement	Description
Tap-Any-Number Provenance	Every figure opens its source document, line, extraction confidence and any override (Section 27 made visible to users).
Return Readiness Score	Green/yellow/red score with the specific items lowering it and one-tap fixes.
Deduction & Credit Hunter	Screens the full profile for commonly missed credits and deductions (education, energy, saver's, child/dependent, home office, mileage) and shows estimated dollar impact before asking.
What-If Simulator	Consumer-facing front end of the Scenario Engine (Section 12); branches never touch the live return.
Audit-Risk Shield	Flags entries that commonly trigger IRS correspondence and requests support up front.
Two Explanation Levels	"Explain like I'm a client" vs. "Explain like I'm a pro" toggle on every AI answer.
Voice & Multilingual	Talk to the Tax AI in English, Spanish and other major languages; spoken answers.
Human Anytime Button	One tap to a real professional from any screen; the AI never traps the user.

C4. Speed & Certainty (upgrades Sections 15, 19; A10)

Enhancement	Description
Pre-Rejection Check	Runs known federal/state reject rules before transmission so Rejection Intelligence (Section 15) is the backup, not the front line.
Live Refund Tracker	Step-by-step status: filed, accepted, processing, approved, deposited, including bank-product settlement (Section 21).
Accuracy Guarantee	Platform-backed coverage of penalties/interest caused by calculation errors; terms reviewed by counsel.
Same-Day Fix Promise	Any rejection gets a plain-language explanation and assigned fix task within the same business day.

C5. Year-Round Value (upgrades Sections 12, 13, 23; Addendum B)

Enhancement	Description
IRS Letter Decoder	Snap any IRS/state notice; AI identifies it, explains it, drafts a response and routes to the Addendum B Resolution Center when needed.
Paycheck Check-Up	Mid-year withholding (W-4) recommendation to prevent surprise balances.
Quarterly Estimate Autopilot	Calculates estimates, sends reminders and links to official payment options.
Life Event Detector	Marriage, baby, home purchase, new business or move updates the plan and checklist.
Next-Year Head Start	Filing a return auto-builds next year's organizer and expected-document list.
Family Vault	Household account for spouse, dependents and parents with separate permissions and consents.

C6. Business Owners (upgrades Sections 4, 11)

Enhancement	Description
Connect Your Books	Link bank, card, payroll and accounting software; AI categorizes and reconciles.
Messy Books Rescue	Reconstruct a year from bank statements alone; priced separately per Section 4.
Entity Advisor	"Should I be an S-corp?" answered with the owner's own numbers through the deterministic engine, then pro review.
K-1 Auto-Flow	Entity returns feed owner 1040s automatically through the unified client graph (Section 7).
Instant Complexity Quote	Owner uploads books and receives the Section 4 complexity-aware quote in minutes.

C7. Professionals & Offices (upgrades Sections 6, 13, 14, 25)

Enhancement	Description
Pre-Built Return Inbox	Client uploads arrive as drafted returns waiting for review.
AI Review Notes	Each return shows what changed vs. last year, risk flags and open questions.
One-Click Client Requests	AI drafts and sends missing-item messages by text/email/app.
Office Dashboard AI	Ask: "How many returns are unsigned? Who is behind? Revenue this week?"
One-Upload Migration	Move My Tax Office (Section 25) accepts a single export bundle and maps it automatically, with verification.
Skill Ladder	Guided Business Preparation (Section 6) tracks preparer progress and unlocks entity types as competence is shown.

C8. Experience Benchmarks (adds to A10 Definition of Done)

Metric	Target
Simple return, upload to signature	Under 10 minutes
Questions asked of a W-2 filer	10 or fewer
Manually typed values	Near zero
E-file rejection rate	Under 1%
Tax AI first response	Under 3 seconds
Extraction accuracy on supported forms	99%+ after verification
Would-recommend score	90%+

C9. Placement in the Roadmap (maps to Section 29 / A11)

Phase	Enhancements added
V1	Five-Screen Experience, Upload Anything, Text-Link Upload, Tap-Any-Number, Readiness Score, Pre-Rejection Check, Refund Tracker, Human Anytime
V2	Connect Your Books, K-1 Auto-Flow, Instant Complexity Quote, Skill Ladder, AI Review Notes, Office Dashboard AI
V3	Deduction Hunter, What-If Simulator, Audit-Risk Shield, IRS Letter Decoder, Estimate Autopilot, Life Events, Family Vault, Messy Books Rescue, Entity Advisor
V4	Auto-Fetch at scale, Voice/Multilingual expansion, One-Upload Migration at scale, Accuracy Guarantee program

C10. Guardrails Carried Forward

AI extracts, classifies, explains, interviews and proposes; the deterministic engine calculates (Section 10). Credentialed preparers sign where required. Every data use flows through the Consent Engine (Section 18, IRC 7216). E-file roles follow Section 19 and IRS Publication 3112. Guarantees, bank products and compensation are reviewed by counsel before launch (Section 31).

> ***Enhanced final statement:*** *Every other app makes you do your taxes. This one does them for you, shows its work, and stays with you all year.*

Addendum D

Facebook & Instagram Marketing Plan - HOUSE OF NOVARAFB

This addendum carries the full Facebook & Instagram Marketing Plan and expands Master Blueprint Section 28. Sections D1-D10 are the plan as written. Section D11 adds alignment items so the marketing covers everything the platform now includes.

D1. Marketing Principle

Do not market the product as one generic tax app. It has four distinct acquisition funnels: independent EFIN tax offices, PTIN preparers in the firm/network, direct taxpayers, and business owners. Each audience should see a different problem, demonstration, offer, landing page, and call to action.

D2. EFIN Tax-Office Campaign

Goal: Acquire high-value professional software customers for Personal Pro and Complete Personal + Business Pro.

> *"You own a tax company. Why are your preparers still doing all the work?"*

Creative demonstration: client uploads documents -> personal AI reads and organizes them -> missing information is flagged -> personal/business tax workflow is prepared -> preparer verifies -> client signs -> e-file workflow. Position the platform as labor-saving capacity and an operating system, not simply another forms package.

CTA: Book Demo / Join Early Access. Use 15-, 30-, and 60-second versions for Reels, Stories and Feed.

D3. PTIN Preparer Campaign

> *"Have a PTIN? Stop turning away business-tax clients because the return is outside your comfort zone."*

Show AI-guided 1040, Schedule C, 1120-S and 1065 preparation; contextual education; Expert Review; and Expert Preparation escalation. The message is that preparers can bring clients, work faster, learn business taxation while working, and earn under the firm compensation structure. Employment/ERO/advertising structure should receive legal/compliance review before launch.

D4. Direct Consumer Campaign

Keep this message simple. Consumers should not hear about EFINs, PTINs or service bureaus.

> *"What if doing your taxes started with one step? Upload your documents."*

Show the taxpayer AI organizing documents, finding missing information, guiding questions, explaining the result and moving the return toward review/signature/e-file. **CTA:** Start My Taxes. January-February should be the heaviest consumer acquisition period.

D5. Business-Owner Campaign

> *"Own an LLC, S-Corp or partnership? Your business tax return is not a $99 tax return."*

Demonstrate prior return + P&L + bank statements + payroll -> business AI organization -> business tax engine -> professional review -> entity return -> K-1 -> owner personal return. Position this as a premium personal-and-business tax relationship.

D6. Meta Funnel

Ad audience	Landing-page path	Primary CTA
Tax-office owner / EFIN	Professional software demo	Book Demo
PTIN preparer	Preparer network / career opportunity	Apply / Join
Direct taxpayer	Consumer tax preparation	Start My Taxes
Business owner	Business tax preparation	Get Business Tax Review

D7. Video-First Creative

Lead with visible automation. Example 30-second Reel:

Time	Scene
0-3 sec	Paperwork and “Still preparing taxes like this?”
3-7 sec	Upload documents
7-12 sec	AI recognizes W-2/1099/business/bank statements
12-18 sec	AI organizes return
18-23 sec	Business-tax education appears
23-27 sec	“96% Ready for Professional Review”
27-30 sec	“Welcome to the future of tax preparation” + Book Demo

D8. Initial 30-Day Test Budget

Campaign	Illustrative test budget
EFIN / tax-office acquisition	$4,000
PTIN preparer recruitment	$2,500
Business-owner tax leads	$2,000
Retargeting	$1,500
Total	**$10,000**

Do not optimize professional campaigns around likes. Track qualified EFIN leads, demo booking, show rate, trial rate, paid conversion, customer acquisition cost and annual contract value.

D9. Retargeting Sequence

Exposure	Message
First	“What if your tax software did most of the preparation?”
Second	Demonstrate a business return.
Third	Founding tax-office offer.
Fourth	15-minute full-platform demonstration.

Build separate retargeting pools for video viewers, landing-page visitors, demo starters and abandoned registrations.

D10. Seasonal Rollout

Period	Primary message
September	Brand reveal, waitlist, future of tax preparation
October	EFIN-owner demos and founding-office recruitment
November	PTIN recruitment and tax-office onboarding
December	Training, onboarding, consumer preregistration
January-February	Full consumer and business-owner acquisition
March-April	Business returns, extensions, complex returns
May onward	Bookkeeping, reconstruction, amendments, year-round business tax planning

Core Message

Do not lead with the software price. Lead with: “What if your tax software did most of the preparation for you?” Demonstrate the labor savings, personal AI assistant, personal and business tax capabilities, guided education, secure cloud Tax Vault and professional review workflow. The premium price is introduced after the buyer understands the capacity and workflow advantage.

Recommended Next Campaign Build

Create 12 launch ads (video + still concepts), exact scripts/copy, four audience-specific landing pages, a 30-day media plan, conversion tracking, and break-even economics for EFIN offices, PTIN preparers, direct consumers and business-tax clients.

D11. Alignment Additions (found in cross-check)

A cross-check of the marketing plan against the full blueprint found platform capabilities with no matching campaign or message. These additions close those gaps:

Gap found	Addition
Tax Resolution Center (Addendum B) not marketed	Add a fifth funnel: **Tax Debt Help**. Message: “Owe the IRS for more than one year? See every year in one place.” CTA: Get My Balance Review. Peak timing May onward, when notices arrive. Must never promise settlement, penalty relief or plan approval (B5).
Upload & Done features (Addendum C) not in creative	Feature Tap-Any-Number, Readiness Score, Live Refund Tracker, IRS Letter Decoder and Human Anytime Button in consumer Reels. The “96% Ready” scene in D7 is the Return Readiness Score (C3).
Year-round retention not marketed	Add a May-December consumer track: Paycheck Check-Up, Quarterly Estimate Autopilot, Life Event alerts, Next-Year Head Start (C5).
Migration not used as an offer	Make Move My Tax Office (Section 25, C7) the founding-office offer in retargeting exposure three.
Bookkeeping / reconstruction not a campaign	Add Messy Books Rescue and Multi-Year Reconstruction ads to the May-onward business-owner track (Section 11, C6).
Consent rules for ad data	Do not use tax-return data for ad targeting or lookalike audiences without Section 7216-compliant consent (Section 18).
Advertising claims review	Guarantee, refund-speed, “AI expert” and earnings claims for preparers need legal review before launch (Sections 31, C4, D3).

Gap found	Addition
Budget for consumer and resolution funnels	The $10,000 test covers professional and business funnels. Add a separate January-February consumer budget and a May resolution test budget, sized after the first 30-day results.
Metrics for consumer funnels	Track cost per started return, upload completion rate, filed-return conversion and next-year return rate alongside D8 professional metrics.

D12. Updated Meta Funnel (with additions)

Ad audience	Landing-page path	Primary CTA
Tax-office owner / EFIN	Professional software demo	Book Demo
PTIN preparer	Preparer network / career opportunity	Apply / Join
Direct taxpayer	Consumer tax preparation	Start My Taxes
Business owner	Business tax preparation	Get Business Tax Review
Taxpayer with IRS balance (new)	Tax Resolution Center	Get My Balance Review

D13. Tax Debt Help Campaign (Fifth Funnel)

Goal: Bring taxpayers and business owners with IRS or state balances into the AI Tax Resolution Center (Addendum B) as a separate, billable engagement (B7).

> *"Owe the IRS for more than one year? See every year in one place."*

Creative demonstration: taxpayer snaps an IRS notice -> IRS Letter Decoder explains it in plain language -> authorized transcripts are pulled -> Tax Period Ledger shows each year's tax, penalty and interest -> combined balance appears -> available options are listed for professional review -> Get My Balance Review.

Element	Specification
Audience	Taxpayers and owners who engage with IRS-notice, back-tax and payment-plan content; retargeted IRS Letter Decoder users
Landing page	Tax Resolution Center: balance review, how it works, professional review, transparent case pricing
Primary CTA	Get My Balance Review
Peak timing	May onward, when notices arrive; secondary push after the filing deadline
Allowed claims	See your balances by year; understand your notices; review available options with a professional
Prohibited claims	Settle for pennies on the dollar; guaranteed penalty removal; guaranteed payment-plan approval; any specific outcome or savings amount
Pricing message	Fixed case fees, never a percentage of tax savings (B7)

D14. Upload & Done Consumer Creative

The "96% Ready for Professional Review" scene in the D7 Reel is the on-screen Return Readiness Score (C3) and should show the live green/yellow/red indicator. Add these consumer ad concepts:

Ad concept	Hook	Feature shown (Addendum C)
Tap Any Number	“Where did that number come from? Tap it.”	Tap-Any-Number Provenance (C3)
Readiness Score	“Know your return is ready before you sign.”	Return Readiness Score (C3)
Refund Tracker	“Stop guessing where your refund is.”	Live Refund Tracker (C4)
IRS Letter Decoder	“Got a letter from the IRS? Snap it.”	IRS Letter Decoder (C5)
Missing Document Radar	“We noticed something you forgot.”	Missing Document Radar (C2)
Human Anytime	“AI does the work. A real pro is one tap away.”	Human Anytime Button (C3)

D15. Year-Round Consumer Track (May-December)

Month	Message	Feature
May-June	“Filed? Next year's taxes just got easier.”	Next-Year Head Start (C5)
June-July	“Is your paycheck withholding right? Check in 2 minutes.”	Paycheck Check-Up (C5)
Quarterly (Apr, Jun, Sep, Jan)	“Estimated payment due soon. We already did the math.”	Quarterly Estimate Autopilot (C5)
Ongoing	“New baby, new home, new business? Your taxes changed.”	Life Event Detector (C5)
November-December	“One account for the whole family.”	Family Vault (C5)

D16. Updated Retargeting Sequence

Exposure	Message
First	“What if your tax software did most of the preparation?”
Second	Demonstrate a business return.
Third	Founding tax-office offer: **Move My Tax Office** - free assisted migration of client data, prior-year returns and carryforwards (Section 25, C7).
Fourth	15-minute full-platform demonstration.

D17. Business-Owner Track (May Onward)

Ad concept	Hook	Capability
Messy Books Rescue	“Books a mess? We rebuild your year from bank statements.”	Section 11, C6
Multi-Year Reconstruction	“Behind on more than one year? Get every year rebuilt and filed.”	Section 11, B6
Entity Advisor	“Should you be an S-corp? See it with your own numbers.”	C6
Instant Complexity Quote	“Upload your books. Get your business tax price in minutes.”	Section 4, C6

Reconstruction leads with balances route into the Tax Debt Help funnel (D13) through the B6 Reconstruction-to-Resolution flow.

D18. Advertising Legal Guardrails

Rule 1 - Tax data and ad targeting: Never use tax-return information for ad targeting, custom audiences, lookalike audiences or retargeting pools without specific, recorded consent that meets Section 7216 requirements (Section 18). Retargeting pools are built from ad and website behavior only.

Rule 2 - Claims review before launch: A qualified attorney reviews these claim types before any ad runs:

Claim type	Example needing review
Guarantees	Accuracy Guarantee terms and coverage limits (C4)
Refund speed	Any refund timing or “faster refund” statement
“AI expert”	Statements that the app replaces or equals a credentialed professional
Preparer earnings	Income or compensation claims in PTIN recruitment (D3)
Resolution outcomes	Any statement about settlement, relief or payment-plan approval (D13, B5)

D19. Expanded Budget & Metrics

The D8 $10,000 test covers professional and business funnels. Add separate test budgets; amounts below are illustrative starting points to be resized after the first 30-day results.

Campaign	Timing	Illustrative test budget
Professional + business test (D8)	October	$10,000
Consumer acquisition (D4, D14)	January-February	$6,000
Tax Debt Help (D13)	May	$3,000
Year-round consumer track (D15)	May-December	$1,000 per month

Funnel	Success metrics
Professional (D8)	Qualified EFIN leads, demo booking, show rate, trial rate, paid conversion, CAC, annual contract value
Consumer	Cost per started return, upload completion rate, filed-return conversion, cost per filed return, next-year return rate
Tax Debt Help	Cost per balance review, review-to-engagement rate, case fee revenue, case completion rate
Year-round	Feature activation, monthly active users, retention into next filing season

Addendum E

Completeness Review - Overlooked Items & Adjustments

A full review of the Master Blueprint and Addendums A-D found the items below that were missing or only implied. Each one now has an adjustment, a home section and a roadmap phase. Legal and regulatory items must be confirmed by qualified counsel before launch.

E1. Legal, Regulatory & Preparer Compliance

Overlooked item	Why it matters	Adjustment	Section	Phase
FTC Safeguards Rule (GLBA)	Tax preparers are treated as financial institutions; a formal information security program is required.	Add GLBA Safeguards program alongside the WISP: qualified individual, risk assessment, vendor oversight, annual board/owner report.	26, A9	V1
EITC/CTC/AOTC due diligence	Paid preparers face penalties without Form 8867 due-diligence records.	Add a due-diligence interview, Form 8867 workflow and record retention for every credit return.	17, A6	V1
Preparer record retention	Preparers must keep copies or lists of returns for required periods.	Retention rules per tenant in the Tax Vault with legal hold and deletion schedules.	7, 26	V1
State preparer rules	Several states register or license preparers and have their own e-file rules.	State credential tracking in the Credential Center and state-by-state launch checklist.	17	V1
Circular 230 / AFSP / representation	Representation rights depend on credential type.	Map each preparer's credential to allowed actions; enforce in B8 permissions.	17, B8	V1
Bank-product consumer rules	Refund transfers and advances carry fee-disclosure and state-law requirements.	Disclosure templates and state rule table inside Bank Products module.	21	V1
Terms, privacy policy, state privacy laws	Required for any consumer app; state privacy laws may apply.	Draft Terms of Service, Privacy Policy, Preparer Agreement, Office License Agreement and Data Processing Addendum.	18, 31	M0
SMS and email consent (TCPA / CAN-SPAM)	The CRM sends texts and emails; consent rules carry statutory damages.	Opt-in capture, quiet hours, STOP handling and consent logs in the CRM.	13, D	V1
Ad endorsements and testimonials	Reviews and influencer content must follow FTC endorsement rules.	Disclosure rules for testimonials, preparer success stories and paid creators.	D18	Launch

E2. Business Foundation

Overlooked item	Why it matters	Adjustment	Section	Phase
Brand and product name	HOUSE OF NOVARAFB appears in marketing; the app name is not defined.	Define the product name, register domains and social handles, and file trademark applications.	Cover, D	M0
Company and IP structure	Software, firm and preparer network may need separate entities.	Confirm entity structure for software company vs. tax firm; assign all IP to the owning entity.	1, 31	M0
Financial model	Pricing exists but no revenue, cost or break-even model.	Build a 3-year model: subscribers by channel, per-return revenue, AI/vendor cost per return, CAC, payback and cash needs.	2, 22	M0
Competitive analysis	Premium pricing assumes a benchmark that is not documented.	Document professional and consumer competitors, prices and features; revalidate the 15% premium.	2	M0
Insurance	Errors in returns or a data breach can be costly.	Obtain errors & omissions, cyber liability and general liability coverage before pilot.	26	M7
Team and hiring plan	No roles or staffing defined.	Define core roles: lead developer, tax content lead (EA/CPA), compliance officer, support lead, marketing lead.	A18	M0
Funding plan	Build and marketing budgets imply capital needs.	Tie the financial model to a funding plan: self-funded, investors or strategic partner.	29	M0

E3. Product & Technology Gaps

Overlooked item	Why it matters	Adjustment	Section	Phase
Mobile apps	Upload-first design depends on phone camera use.	Native iOS/Android apps or a mobile-first web app for V1 taxpayers.	C1, A3	V1
Accessibility	ADA/WCAG compliance broadens reach and lowers legal risk.	Meet WCAG 2.1 AA on all taxpayer and preparer screens.	A3	V1
Taxpayer identity verification	Upload-and-file needs strong identity proof to stop fraud.	Identity verification at signup and before e-file; IP PIN support.	16	V1
AI vendor data rules	Taxpayer data must not train outside models.	Contract terms: no training on customer data, retention limits, region controls; log in AI Gateway.	A7, 18	M0
AI quality evaluation	Wrong explanations harm trust even when math is right.	Monthly AI evaluation set, accuracy targets and human review of sampled answers.	A14	V1
Uptime and tax-season capacity	Peak season outages lose customers.	Uptime target, load tests at 10x expected peak, status page and incident playbook.	A15	M7
Payment card security	Taking prep fees by card requires PCI DSS compliance.	Use a PCI-compliant processor with hosted payment fields; no card data on platform servers.	22	V1
Licensed tax-engine vendor selection	V1 depends on a licensed engine and transmitter.	Shortlist and sign engine/transmitter vendor before M3; confirm data export rights.	19, A13	M0
Product analytics	Funnel metrics need event tracking inside the app.	Event tracking for upload, questions, readiness, sign and file steps, tied to D19 metrics.	D19	V1

E4. Go-to-Market & Operations Gaps

Overlooked item	Why it matters	Adjustment	Section	Phase
Channels beyond Meta	The plan only covers Facebook and Instagram.	Add Google Search (high-intent tax queries), YouTube, TikTok, email and SMS nurture, and tax-industry events.	28, D	Launch
Referral program	Tax clients and preparers refer each other.	Client referral credit and preparer-refers-preparer bonus, within compensation and endorsement rules.	22, D	V2
Pilot plan	No defined beta before full launch.	Recruit 5-10 founding offices; define pilot success criteria tied to A10 and C8.	A11 M7	M7
Launch timeline vs. tax season	October is the current campaign month; the V1 build is large.	Decide target filing season and confirm V1 scope fits it; otherwise run a waitlist and pilot season.	29, D10	Now
Customer support operations	Upload-and-done still needs human help at peak.	Support staffing plan, help center, chat, phone escalation and response-time targets.	C3, 13	V1
Office onboarding and training	Offices need setup and staff training to succeed.	Onboarding checklist, training videos, certification path linked to the Skill Ladder.	6, C7	V1
Reviews and reputation	Consumer trust depends on public ratings.	Post-filing review requests and app-store rating prompts, with response process.	D	V2
Exit and data portability	Offices worry about lock-in.	Documented client-data export for offices leaving the platform.	25	V2

E5. Priority Actions Before Development Starts

1. Define the product name and file trademarks.

2. Build the financial model and confirm the target filing season.

3. Select the licensed tax-engine and e-file transmitter vendor.

4. Engage tax and privacy counsel for Sections 31, D18 and E1.

5. Draft Terms, Privacy Policy and office/preparer agreements.

6. Hire or contract the lead developer and tax content lead.

7. Recruit 5-10 founding offices for the pilot.

> ***Completeness statement:*** *Nothing in the original plan was removed. Addendum E adds the missing business, legal, technology and go-to-market pieces so the full plan can move from blueprint to build.*

Addendum F — NOVARA Tax OS

Pricing, AI Tax Preparation, Business Returns & Bank-Product Integration
Developer implementation supplement to the 32-page AI Tax Business Operating System Master Blueprint (Enhanced). This addendum extends, and does not replace, the Master Blueprint or Addenda A–E. Approved decisions are identified separately from provisional proposals.

F1. Customer Segments and Commercial Separation

Support three distinct paths: (1) independent EFIN tax-office owners licensing NOVARA Tax OS; (2) independent tax preparers (TPs) assigned to and operating under an authorized sponsoring office; and (3) direct individual taxpayers using NOVARA's consumer service. Each path requires separate enrollment, permissions, contracts, billing, and reporting. A PTIN alone does not grant authority to file under another office's EFIN.

F2. Approved Independent Tax Preparer Fees

Transaction	NOVARA charge	Status
Personal return (e.g., 1040)	$89.99 per return	Approved
Business return (1065, 1120-S, 1120)	$89.99 base + $149.99 business AI surcharge = $239.98 total	Approved
Bank-product charges	Separate, partner-determined	Partner contract pending

These are NOVARA charges, not automatically bank fees or additional taxpayer charges. The legal payer (TP, sponsoring office, or taxpayer), fee timing, funding mechanism, refunds/reversals and disclosure language must be established in signed agreements. Never collect the base $89.99 twice on a single business return.

F3. Tax-Office Owner Subscription Strategy

Approved floor: The lowest annual tax-office subscription is $899. **Pricing objective:** Business-enabled office tiers should be priced $150 below a verified, genuinely comparable competitor package. The comparator must be documented by date, included return types, users, states, e-file costs, bank integrations and usage limits. Do not automatically apply a $150 discount to a mismatched package.

Office tier	Annual pricing	Business-return access
Starter Office	$899 minimum	No; personal-return features per published tier scope
Personal Pro	$1,299 proposed, not final	No; personal-only tier
Business-enabled / Complete Pro	Competitor comparable price less $150; final amount TBD	Yes, for supported 1065/1120-S/1120
Enterprise / Service Bureau	Custom agreement	Contract-dependent

The earlier $1,799 Complete Pro figure is superseded as a fixed commitment by the newer competitor-minus-$150 instruction; no final competitor-based price has yet been verified or approved. Subscription fees, per-return fees, supported states, fair-use limits, and included AI processing must be shown transparently at checkout.

F4. Direct Consumer Preparation Pricing — Provisional

Return scenario	Proposed client price
Basic W-2 / Form 1040	From $149
W-2 with dependents/credits	From $249
1099 / self-employed	From $349
Schedule C business	From $449
Rental property / Schedule E	From $399
Amended return	From $199
1065 partnership	From $699
1120-S S corporation	From $799
1120 C corporation	From $899

These consumer amounts were discussed as proposals and are not approved final prices. Business entity returns are separately priced premium services. State filings, cleanup/reconstruction, amendments, expert review and tax resolution may require separate disclosed charges; do not double-bill overlapping services.

F5. Upload-and-Done AI Preparation Workflow

For all supported return types: secure upload -> scan/classify/extract -> taxpayer/entity/year match -> source-linked verification -> targeted missing-information questions -> canonical tax facts -> deterministic, tax-year-specific calculation -> evaluate legally supported deductions, credits, elections and scenarios -> diagnostics -> appropriate preparer/expert review -> taxpayer review/signature -> authorized e-file transmission -> acknowledgment/rejection handling -> Tax Vault and status tracking.

AI should do most of the data-entry, analysis and draft preparation work. “Maximum legal refund” means maximizing substantiated tax benefits and minimizing lawful liability, not guaranteeing a refund or inventing expenses, dependents, credits or evidence. Tax calculations and eligibility are authoritative only when confirmed by the versioned rules engine and required human review. No autonomous transmission without valid credentials, signatures, consents and filing gates.

F6. Business AI — Premium Feature and Permissions

Enable 1065, 1120-S and 1120 through the business-enabled office tier, the TP business surcharge, or the direct-consumer business service. Collect financial statements, trial balance, payroll, ownership, capital/basis, assets, loans and prior-year documents; produce workpapers, K-1s and owner-1040 links with evidence provenance. Unsupported entities, incomplete books, material uncertainties and representation questions must escalate. Feature flags and server-side entitlements must enforce plan/return access.

F7. Banking Products, Settlement and Fees

NOVARA may integrate refund transfers, refund advances where approved, and other bank products via contracted financial partners. Partners set their own bank-product fees and underwriting terms. NOVARA service/technology fees are separate and may be deducted from refunds only when permitted by bank agreements, applicable law and clear taxpayer authorizations. Display an itemized estimate showing preparation, NOVARA, sponsoring-office, bank and other approved charges; identify each recipient. Offer compliant alternatives for clients with no refund, no bank product, or upfront payment.

Settlement ledger must track gross preparation fee, approved fee allocations, bank fees, NOVARA fees, preparer/office compensation, payment status, adjustments, chargebacks, rejects and refunds. Do not assume a bank will remit the NOVARA fee until its agreement explicitly authorizes that collection and distribution.

F8. Developer Requirements and Acceptance Tests

Implement configurable fee catalog keyed by tax year, tenant, role, return type, jurisdiction and approved bank product. Maintain immutable price/version snapshots on each engagement. Calculate $89.99 for TP personal returns and $239.98 exactly for TP business returns; prevent duplicate charges. Restrict business return creation to eligible office tiers or paid TP/direct-client workflows. Show itemized fees and obtain required approvals before charge or e-file. Separate bank fee configuration from NOVARA fees. Test no-refund/upfront-pay, rejected and amended returns, bank settlement failure, cancellation, reversal, multi-state complexity and cross-tenant isolation.

F9. Open Decisions Before Production Launch

Finalize: the verified competitor benchmark and annual business-office tier price; whether and how NOVARA per-return fees are paid by TPs, offices or consumers; the bank partner and its authorized fee settlement; return-fee trigger (prepared, transmitted, accepted or funded); whether business AI surcharge applies to all business return complexities; state/additional filing prices; support limits; and the final consumer rate card. Legal/compliance review of taxpayer disclosures, tax-data use, bank products and e-file roles is required.

Implementation instruction: Add this as Addendum F following Addendum E. Preserve the original 32 pages unchanged. Treat approved fees and the $899 floor as requirements; treat other numeric examples and tier proposals as configurable pending approval.
